Abstract

Late Roman and Early Byzantine architectural elements from northern Greece are analyzed isotopically and under optical cathodoluminescence microscopy to determine their quarry of origin. Thirteen pieces come from Nea Anchialos, two from Thessaloniki, and one from Philippi. Marble is assigned to the quarries of Proconnesos, Thasos, and Philippi. On the basis of their marble, typology and style, the sculptures are attributed to sculptors from northern Greece or from Constantinople. The sculptors may have exported their works fully finished or carved them at the building sites in northern Greece. Sculptors from Constantinople clearly established workshops in northern Greece and made use of Thasian marble.

Keywords

cathodoluminescence microscopy, Proconnesian marble, Thasian marble, Philippi marble, Late Roman, Early Byzantine, architectural decoration

Introduction

Northern Greece, centered on Thessaloniki, was the site of major campaigns of construction in Roman and Early Byzantine times and was richly endowed with marble quarries, located in the Vermio mountains of central Macedonia, in the mountains around Philippi, and on the island of Thasos. Nonetheless Constantinople and northwest Asia Minor, with its vast marble quarries on Proconnesos (Marmara Island), has long been recognized as the dominant artistic influence and a primary source of material for the architectural decoration of the northwestern shores of the Aegean (Fig 1). Art historical analysis and optical examination of architectural decoration have made the Asiatic role clear.¹ On

Fig. 1. Map of Aegean area with sites mentioned in text

the other hand, the northern Greek quarries were active enough to penetrate the international market; Thasos, for example, exported unfinished Ionic capitals to Italy and other parts of the Mediterranean.² Archaeometric studies have identified Thasian marble in Early Byzantine chancel screens of Constantinopolitan type at Delphi.³ In recent years we have undertaken archaeometric studies that further confirm the use of Thasian and other local northern Greek marbles in northern Greece by workshops of a Proconnesian character.⁴ These Asiatic-style pieces in northern Greek marble must have been carved by travelling sculptors from Proconnesos or Constantinople or else by their branch offices in northern Greece. Central and southern Greece also developed workshops that were influenced by Constantinople but had some

distinctly local features⁵ and usually made use of fine-grained local marble (macroscopic observation).

The city of Nea Anchialos (province of Magnesia) offers a fine opportunity to explore the relationship between craftsmanship in marble and sources of supply in the borderlands between central and northern Greece. Excavation has produced a series of five basilicas with columns, church furniture, and magnificent capitals,⁶ some of which are obviously of Proconnesian marble and most of which are of types and styles known from Constantinople. Some Early Byzantine products of southern or central Greece have also reached the city.⁷ Georges Soteriou, the excavator of many of the richly decorated churches in Nea Anchialos thought that the marble they used was local.⁸ This study attempts to distinguish on a scientific basis the different sources for the marble and the workmanship of thirteen pieces from Nea Anchialos, two from Thessaloniki, and one from Philippi.

Methodology

Proconnesian marble is well known for its strongly marked dark gray bands, which were particularly appreciated in column shafts. Northern Greek marbles from Thasos and Philippi tend to have less emphatic banding and coarser grain. Conspicuously Proconnesian pieces were generally excluded from our sampling, but pieces that seemed to have relatively coarse grain, as well as some

cases that seemed particularly interesting, were sampled for laboratory analysis. Multimethod testing based on optical cathodoluminescence microscopy (CL) and analysis of stable isotopes of carbon and oxygen (Fig. 2), conducted at the Université de Reims Champagne-Ardenne, has been the primary technique used to determine marble sources. Study of the quarries has shown that marble from Proconnesos has blue CL,⁹ marble from Cape Vathy red CL, and marble from Aliko and Cape Fanari orange CL of varying strengths.¹⁰ In practice, the distinctions in color are not always as sharp as this terminology might suggest, and in some of these cases optical determination of grain size has also been used. In some cases the analysis would have supported a provenance from Paros, but such a result has been excluded on archaeological grounds; research on Paros makes it very unlikely that the island exported marble in Early Byzantine times.¹¹ Some sculptures in our analyses had CL that appeared to be northern Greek but did not fit easily into the various quarries on Thasos. More research is required for quarries at Philippi, in the Vermio mountains near Veria, and at Sendoukia near Dion.

In approaching issues involving workshops, we have adopted the approach of Jean-Pierre Sodini in classifying architectural sculptures on the basis of motifs and decorative schemes.¹²

Constantinopolitan workshops and Proconnesian marble: prefabricated imports or travelling workshops

Nea Anchialos presents a number of sixth-century chancel barriers with rich designs of a Constantinopolitan character, and several have proven to be made of Proconnesian marble. They could either have been sent in a finished state or been carved by workmen travelling from Proconnesos to Magnesia. A barrier in Basilica C features peacocks flanking vines growing out of a crater (BP3, Fig. 3); the lobed and dotted crater is closely related to similar craters of the church of Hagios Polyuktos in Constantinople (524–527).¹³ A panel with cross, vines, and peacock, BP4, is similar and likewise early Justinianic (Fig. 4). Another panel has interlocking rows of palmettes (BP2, Fig. 5). There are several examples of similar palmette panels in Greece, and it has been thought that the design may have originated there.¹⁴ The analysis of the marble of BP2, however, indicates a Proconnesian origin for its marble and probably a Constantinopolitan origin for its design as well.

An Ionic impost capital in Hagios Demetrios, Nea Anchialos makes use of Proconnesian marble (HD3, Fig. 6),¹⁵ and the cross-and-acanthus decoration on its impost

block can be almost perfectly matched on an impost block in the garden of Istanbul Museum. In all probability the sculptor of HD3 came from Proconnesos or Constantinople.

A Corinthianizing pier capital in Hagios Demetrios with four acanthus leaves (HD5, Fig. 7) is a long-established type in the Asiatic/Proconnesian repertory, and, in spite of its very coarse grain, is made of Proconnesian marble; its isotopic ratios are suitable for the Cape Fanari quarry on Thasos, but the CL seems decisively Proconnesian. The nicely curved volutes indicate a date around the middle of the fifth century. A similar pier capital in Amphipolis is, in fact, made of marble from Cape Fanari, Thasos¹⁶ and could have been made by the same Macedonian- or Thasian-based Constantinopolitan workshop.

Branch offices of Constantinopolitan-Proconnesian workshops in northern Greece: Proconnesian designs in Thasian marble

Eastern sculptors came to Macedonia and used local marble by the 3rd century at least. A cornice (a *cyma recta*) decorated with a row of palmettes in Thessaloniki is made of marble from the Alikı quarries on Thasos (TRSP1, Fig. 8). *Cymatia* like this with a row of palmettes mounted on scrolls linked by horizontal bars and with petals that curl alternately up and down are typical of Asiatic workshops from the second century onward.¹⁷ Several similar cornices made of conspicuously banded Proconnesian marble are in Istanbul; one is in the garden around Hagia Sophia, and two are in the garden of the Archaeological Museum.¹⁸ In TRSP1 and the piece at Hagia Sophia, the petals that curl downward are lobed and acanthus-like, a detail that is not easy to parallel elsewhere. Therefore except for its northern Greek material, TRSP1 is thoroughly Asiatic and the product of a transplanted workshop.

Among the sixth-century chancel barriers with rich designs of Constantinopolitan character at Nea Anchialos there is one made of Alikı marble (BP1, Fig. 9). It has interlacing squares and circles, and in spite of its Thasian marble, its design probably originated in Constantinople; a fine openwork chancel barrier with this basic pattern in Ravenna is made of Proconnesian marble¹⁹, and it must have been sent there from the capital. The piece in Nea Anchialos was apparently made by a Constantinopolitan workshop established in northern Greece.

Two Ionic impost capitals in Nea Anchialos present Proconnesian designs executed in marble from Alikı,

Fig. 9. BP1, photo and CL: Chancel barrier with interlaced squares and roundels, Nea Anchialos, 6th century, Thasian marble

Thasos. One is from Hagios Demetrios (HD2, Fig. 10)²⁰. The other is from Basilica C (BP6, Fig. 11). The decoration on the impost block of BP6 virtually reproduces the ornament on an Ionic impost capital made of Proconnesian marble in the Lechaion Basilica of Corinth, even to the rare detail of pomegranates emerging from the acanthus.²¹ The design was probably transmitted by a Proconnesian workshop in its travels through Greece.

In general, these transplanted and mobile workshops based in northern Greece produced work that can scarcely be distinguished from that found in their area of origin in Proconnesos and Constantinople. The sculptures in marble from Thasos, however, may have

century, marble from
Aliko, Thasos

a slightly different flavor; they can seem a little looser, softer, and less deeply cut, which could in part be due to the coarser-grained material. In the case of the Ionic impost capital HD2, the movement of the vines seems a little more awkward, aggressive, and spontaneous than in pieces made of Proconnesian marble; the sculptor could have been availing himself of a bit of freedom in the provinces.

Local Greek workshops using Thasian marble

Jean-Pierre Sodini has described a distinct regional style of architectural decoration in marble of southern and central Greece, and this style reached northwards to Thessaly and Nea Anchialos.²² Sodini's analysis is based on motifs rather than nuances of carving, and some of the characteristic motifs and compositions of southern Greece turn up among the pieces made of Thasian marble at Nea Anchialos.

A colonnette capital from Basilica C in marble from Cape Fanari is decorated with four very stylized acanthus leaves (BP5, Fig. 12). Since it lacks volutes, it could be considered an impost capital. Colonnette capitals with four leaves and without volutes appear at Delphi,²³ and leaves with veins that curve from one point to the next are very common in southern Greece.²⁴ The Nea Anchialos piece seems heavily influenced by the mainland Greek environment and is probably the product of a local (northern or central Greek) sculptor.

Chancel pillars from Basilica C are made of Aliko marble and are decorated with tall crosses with incised borders (HD4, Fig. 13). The border might be an imitation of Constantinopolitan crosses that are overlaid with a second cross in relief, as in BP4 (Fig. 4),²⁵ but the incised border could also be a local feature. Crosses in fifth century Asia Minor have a single central incision, while incised borders seem to be common in southern Greece from the early fifth century onward.²⁶ Therefore the Nea Anchialos piers were probably designed and carved by local Greek sculptors.

A richly ornamented section of trabeation in the Rotunda Museum in Thessaloniki stands somewhat by itself, with no strong links to either southern Greece or Asia Minor (TRM, Fig. 14). The trabeation (an Ionic

entablature: i.e., without frieze) is made of Aliko marble, and its shallow cutting, its defective astragal, and its stylized cymation make it clear that it is Late Antique if not Early Byzantine (4th or 5th century). The braided astragal orients it toward the Asiatic tradition, but it is so individual that it is almost certainly an independent product of a local Macedonian workshop.

A chancel slab made of a northern Greek marble, perhaps from Cape Fanari, Thasos, in the Martyrion Basilica, Nea Anchialos is decorated with a roundel of meanders (MB1, Fig. 15). The design is probably of Constantinopolitan origin. There is a richly worked out example in Veria, Macedonia (unpublished?) that has many mainland Greek details, but a splendid example also appears on a chancel barrier in Siponto, Apulia, (south Italy) and is apparently made of Proconnesian marble. The Siponto piece is therefore very likely to be an import from Constantinople,²⁷ and it is also likely that the design emanated from the capital city. In any case, the incised technique, the heavy frame, and the central pinwheel brand MB1

as an independent production by a local workshop not directly connected with the Proconnesos.

A chancel barrier is decorated with incised vines and a pair of peacocks flanking an amphora in a very sketchy style that belongs more to the Dark Ages than to Early Byzantine times (HD1, Fig. 16).²⁸ The piece is marble from the Aliko quarries and exhibits no evident signs of being reused. The composition, a crater with descending vines flanked by peacocks, is that used in the chancel barrier from Basilica C (BP3, Fig. 3a), but the stylization of forms and the shallow carving is clearly much later. The carving of HD1 seems to have more to do with the ambos on Paros²⁹ than with Constantinople. Even the ambos on Paros, as well as a sarcophagus of Aliko marble

in Siracusa, all probably datable around 600,³⁰ have more sculptural relief than HD1, which could be even later. Thasos is thought to have been “destroyed” in the Slavic invasions of ca. 620,³¹ but this chancel barrier could be evidence for a return to activity after that date.

Conclusions

Using CL and stable isotopes of C and O, it has been possible to distinguish “imported” Proconnesian marble from northern Greek marble (mainly from Thasos) in architectural decoration in Nea Anchialos and Thessaloniki. Constantinopolitan workshops exported finished pieces in Proconnesian marble to northern Greece, but they also traveled there, as Constantinopolitan-type pieces in Thasian marble prove. Some Thasian marble pieces in Nea Anchialos also reveal motifs from southern Greece and are products of local northern Greek workshops. A block of marble in a church at Philippi proved to be from the city’s own quarries.
