ROMAN AND EARLY BYZANTINE SARCOPHAGI OF CALCITIC MARBLE FROM THASOS IN ITALY: OSTIA AND SIRACUSA

Donato Attanasio¹, John J. Herrmann², Robert H. Tykot³ and Annewies van den Hoek⁴

⁴ Harvard Divinity School, Cambridge, Massachusetts, United States (annewies_vandenhoeck@harvard.edu)

Abstract

Four sarcophagi in Ostia and one in Siracusa are made of marble that appears macroscopically to be from the island of Thasos. Samples were analyzed with stable isotope ratios of carbon and oxygen. In addition, the Siracusa sarcophagus was analyzed with electron paramagnetic resonance spectroscopy (EPR), and the maximum grain size (MGS) and color were measured. The analyses confirm that the sarcophagi were made of marble from Aliko on Thasos. The Ostian pieces date from the third century, and the Early Byzantine example in Siracusa can be dated to between 590-620 CE.

stable isotopes, EPR, maximum grain size, Thasos, Aliko, sarcophagi, third century, post-Justinianic

Thasian calcitic sarcophagi in the West: previous research

Sarcophagi made of calcitic marble from Thasos were frequently exported to nearby Thessaloniki,¹ but in Italy they seem to be rarities. So far the only examples identified are unfinished chests in a cargo that sank around 200 CE off Torre Sgarrata near Taranto.² The cargo contained sarcophagi that came from both the calcitic marble quarries of Cape Fanari and the dolomitic marble quarries of the Cape Vathy-Saliara area on Thasos; the latter are well known as a source of sarcophagi for the Italian market.³ The only other previously confirmation of a calcitic Thasian marble sarcophagus in the western Mediterranean, however, is a lid from the quarries of Aliko, Thasos in Arles.⁴ Now, however, sarcophagi of

calcitic marble from Thasos can be identified in north Italy at Milan and Ravenna⁵ and on the western side of the peninsula at Ostia and in Siracusa, Sicily. It will be these latter two sites that will occupy us here.

Thasian calcitic sarcophagi at Ostia

Four sarcophagi at Ostia appeared to be of the grayish, very coarse-grained streaked and spotted calcitic marble of Thasos. One, inscribed for a Julius Tannonius Donatus, was complete to its lid (Fig. 1), while the others were fragmentary (Figs. 2-4). Samples from each sarcophagus, including the lid, were analyzed at the University of South Florida (USF), and the ratios of stable isotopes of carbon and oxygen proved to be compatible with the quarries at Aliko on Thasos (Table 1). Non-destructive pXRF analysis revealed no magnesium (Mg) and relatively low concentrations of manganese (Mn) and strontium (Sr). These data support the isotopic and other data assigning these objects to a large-grained, calcitic, Thasos-Aliko marble source.

A Thasian calcitic sarcophagus in Sicily

A Christian sarcophagus in the Galleria Regionale di Palazzo Bellomo in Siracusa⁸ is also made of a grayish marble with very large grain that appears macroscopically

Table 1. Sarcophagi at Ostia with marble from Alikı, Thasos

 Fig. 1. Sarcophagus of Julius Tannonius Donatus. Ostia, Piazzale dei Marmi, P85, P85A (lid). Marble from Alikı, Thasos, 2nd half of 3rd century

 Fig. 2. Fragmentary strigillated sarcophagus, from Pianabella, Isola Sacra. Ostia, Piccolo Mercato, inv. SBAO46853. Marble from Alikı, Thasos, 3rd century

 Fig. 3. Fragmentary sarcophagus with Eros or Season with crossed legs. Ostia, Piccolo Mercato, unnumbered. Marble from Alikı, Thasos, 3rd century

Fig. 4. Strigillated sarcophagus, Ostia, Via delle Tombe, unnumbered. Marble from Aliko, Thasos, 3rd century

to come from the island of Thasos (Figs. 5-6). Two small chip samples were taken and were analyzed at the Istituto di Struttura della Materia, CNR, Roma (ISM) with multiple techniques: paramagnetic resonance spectroscopy (EPR), stable isotope ratios of carbon and oxygen, maximum grain size (MGS), and color. The analyses confirmed that this sarcophagus was also made of marble from the quarries of Aliko on Thasos (Table 2, Figs. 7-8).

Probable quarry of origin for the Siracusa sarcophagus

Analysis by linear discriminant function of the 6 variables in Table 2 are shown graphically in Fig. 8. Distance represents the distance of the sample from the center point of a field. Relative probability assumes that the sample belongs to one of the groups in the selection.

Description	Site	Distance a.u.	Rel. prob.	Abs. prob.
			%	%
Sample O	Th Aliko	7.5	84	27
Sample U	Th Aliko	8.2	85	22

Table 2. Shown graphically in Fig. 8. Distance represents the distance of the sample from the center point of a field

Even if not especially high, the absolute probability is well above the threshold and confirms, in agreement with the isotopic results, that the provenance of the marble from Thasos is clear and unquestionable. The rate of success of the method is 77%. This means that 77% of the database samples are correctly re-assigned to their true quarries of provenance using the statistical classification rule. The unknown sample is assigned to the most probable quarry of

provenance and the results are deemed to be statistically reliable if the probability values are above their thresholds.

Discussion, chronology, and historical significance

The chests of the four sarcophagi in Ostia (Figs. 1-4) were clearly decorated in Ostia or Rome, probably in the 3rd century.⁹ The inscription of Tannonius has been dated to the second half of the third century. In three cases the front of the chest is strigillated, and one is carved with a pair of legs and a basket, probably from a harvest or Bacchic scene. All these motifs are Western and alien to northern Greece. The lid of the sarcophagus of Tannonius (Fig. 1), on the other hand, is very similar to lids in the north Aegean. In Thessaloniki and on Thasos, Thasian marble sarcophagi often have double-sloped lids like this one with carefully detailed roof tiles and acroteria decorated with half-palmettes.¹⁰ The Tannonius sarcophagus apparently arrived in Ostia with a finished lid and an undecorated chest; the combination is also known from Thasos itself.¹¹

In the late second and the third century, Rome imported many unfinished marble chests from the Proconnesian quarries. Thasian calcitic marble resembles Proconnesian, and the Thasian sarcophagi may represent an attempt to capture a part of the trade in low-cost,

Table 2. Analytical data for the two samples of the Siracusa sarcophagus inv. 23545 compared with a selection of marble groups considered to be possible provenances. Group properties include the mean and extreme values.

Fig. 5-6. Sarcophagus with three crosses, Galleria Regionale di Palazzo Bellomo, Siracusa, inv. 23545. Marble from Aliko, Thasos, ca. 600 CE

grayish marble between the Proconnesus and the West. The rather dark color of the Tannonius sarcophagus and its coarse grain, which makes reading its inscription rather difficult, may have contributed to making the Thasian less popular than the Proconnesian sarcophagi.

The sarcophagus in Siracusa (Figs. 5-6) has a Christian decoration and is much later in date than the Ostian pieces. Its front is decorated with three crosses, each mounted on two steps. Between the crosses appear disks, which were probably intended to be carved as stars or rosettes. The back of the sarcophagus has three crosses without steps or intervening disks.

The sarcophagus has been dated to the eighth century,¹² and the general composition of three Latin crosses can be paralleled on several sarcophagi of the eighth and ninth centuries in Ravenna.¹³ If eighth century in date, the decoration would have been applied long after the chest in Siracusa was shipped from Thasos; there are no indications that the marble trade between the Aegean and Italy continued at such a late date. Thasos itself was

apparently devastated by Slavic invaders around 620,¹⁴ presumably putting an end to the island's marble trade.

Both the chest and its decoration, however, appear to be before the eighth century. The chest does not appear to be reused or recut; close inspection reveals no trace of earlier carving. The decoration is rather irregular, but so is the shape of the chest. Everything seems tilted, both the crosses and the contours of the chest, so that the sarcophagus seems intended to be placed on a slope. Sarcophagi decorated with three Latin crosses also appear in Early Byzantine times; there are examples in southern Italy, at Capri¹⁵ and Messina (Fig. 9)¹⁶ that may be of the late sixth or early seventh century, and crosses are enclosed in niches and/or accompanied by lambs or peacocks in late fifth and early sixth century sarcophagi at Ravenna (Fig. 10).¹⁷ Three crosses appear sporadically in the East, but much more common is a variant with a cross or christogram in a roundel flanked by Latin crosses.¹⁸ The three-cross motif, however, is known on Thasos itself: the composition appears on an Ionic impost capital of the mid-sixth century found at the Aliko quarries (Fig. 11).¹⁹ In general, the simple crosses on the Palazzo Bellomo sarcophagus resemble Early Byzantine rather than Carolingian crosses, whose ends are usually embellished with curls.

It is likely that the Bellomo sarcophagus dates from late in the Early Byzantine period. A cross on a stepped podium seems to be a relatively late motif. The earliest example seems to be on a sarcophagus in Ravenna dated to the late fifth century (Fig. 12).²⁰ The Ravenna example is quite different from that in Siracusa; there are five steps instead of two, and two rivers of paradise flow from them. On an ambo, apparently of Proconnesian marble, in the Church of Al Mo'allaqa, Cairo a cross stands on three steps (Fig. 13).²¹ The ambo is also decorated with a shell niche that resembles niches on sarcophagi

Fig. 14. Marble inlay with cross on staircase, 527-563 CE, Hagia Sophia, Istanbul

in Ravenna of the late fifth and early sixth centuries.²² A cross on steps, this time four in number, appears in an inlaid marble panel in Hagia Sophia, Constantinople, built and repaired by Justinian (527-565) (Fig. 14).²³ The main period of use of the stepped cross motif is in post-Justinianic times; a cross on four steps became a standard motif on Byzantine gold coins (solidi) from time of Tiberius II (578-82)²⁴ well into the eighth century (Fig. 15). Crosses on steps appear on ambos on Paros that have been dated around 600 (Fig. 16).²⁵ A cross on a globe above three steps appears on Byzantine silver coins (hexagrams) from 610-685 (Fig. 17) and on a 7th or 8th century Proconnesian marble parapet from Alacam on the Black Sea coast of Turkey (Fig. 18).²⁶ A cross on three steps appears in the apse mosaic of Hagia Irene, Constantinople, shortly after 753 (Fig. 19).²⁷ Stepped crosses are incised in the quarries of Proconnesus,²⁸ and

several are accompanied by inscriptions and abbreviations typical of the ninth century and later.

The modest level of workmanship of the Siracusa sarcophagus probably indicates that it is not an especially early example of the cross on steps motif. Its “reduced” arrangement with only two steps also suggests a relatively late date; a two-step arrangement is seen in one of the ambo panels from Paros of ca. 600 (Fig. 12) and the chancel barrier from Alacam (Fig. 14). The Palazzo Bellomo sarcophagus then could well have been both quarried and decorated around 570-610. Since sarcophagi were usually shipped from Thasos in an unfinished state,²⁹ it is likely that the Palazzo Bellomo example was decorated in Sicily.

Conclusions

Macroscopic examination led to tentative identifications of sarcophagi in Ostia and Siracusa as Thasian, and isotopic analysis and analysis with EPR have confirmed these conjectures and established the origin of the sarcophagi in the calcitic marble quarries of Aliki. Previously, sarcophagi of calcitic marble from Thasos had been known only from shipwrecked cargoes, and these new identifications add substance to the trade in prefabricated

Fig. 19. Mosaic with cross on steps, shortly after 753, Hagia Irene, Istanbul

and semifinished sarcophagi from Thasos in Italy. Art historical study of the decoration and workmanship of the sarcophagi provide chronological markers. The chests in Ostia were decorated locally in the third century, but the lid of one of them seems to have been both extracted and decorated on Thasos. The sarcophagus in Siracusa was extracted and decorated on Thasos in the late sixth or early seventh century. This result is important in establishing that marble products were exported from Thasos to Italy toward the end of the Early Byzantine period and thus at a much later date than previously known.

ACKNOWLEDGMENTS

Our thanks for understanding and cooperation goes to Carmela Vella director of the Galleria Regionale di Palazzo Bonomo, Siracusa and to the Soprintendenza Speciale per il Colosseo, il Museo Nazionale Romano, and l'Area Archeologica di Roma, and especially to the Area Archeologica di Ostia, to the Soprintendente Francesco Prosperetti and Paola Germoni, and to the former Soprintendente Anna Gallina Zevi.
