ZADATAK ZA ZAVRŠNI RAD

Tema: Proračun nosive konstrukcije zidane građevine

Opis zadatka: Potrebno je napraviti proračun nosive konstrukcije zidane građevine. Nosiva konstrukcija je omeđena zidana konstrukcija. Prva etaža međukatne konstrukcije je AB ploča, druga i treća etaža su sitnorebrasti stropni sustav s prednapregnutim gredicama, a četvrta etaža je sustav s lakobetonskom ispunom „bijeli strop“. Građevina se nalazi u potresnoj zoni gdje se očekuje vršno ubrzanje podlage $a_g = 0.22 \text{ g}$ s povratnim periodom od 475 godina. Proračunom je potrebno dokazati mehaničku otpornost i stabilnost konstrukcije u cjelini, kao i nekih tipičnih konstrukcijskih elemenata. Proračun treba provesti prema europskim normama EC1, EC6 i EC8, dopunjeno podatcima o opterećenjima prema odgovarajućim hrvatskim normama i pravilnicima.

1. TEHNIČKI OPIS

1.1 Općenito

Predmet ovog Završnog rada je proračun nosive konstrukcije stambene zgrade.

Građevina je četveroetažna, nepravilnog tlocrtnog oblika. Ukupna bruto površina građevine iznosi 187.15 m^2 , a ukupna visina sa nadozidom 12.5 m , mjereno od podne ploče prizemlja. Građevina se nalazi u potresnoj zoni gdje se očekuje vršno ubrzanje podloge $a_g=2 \text{ m/s}^2$ s povratnim periodom od 475 godina, II. području opterećenja vjetrom i području D opterećenja snijegom.

Međukatna konstrukcija iznad 1. etaže je armirano-betonska ploča, iznad 2. i 3. etaže je sitnorebrasti stropni sustav s prednapregnutim gredicama, a iznad 4. etaže sitnorebrasti stropni sustav s lakobetonskom ispunom - BIJELI STROP. Konstrukcija temelja je armirano-betonska, a sastoji se od: temeljnih traka, nadtemeljnih zidova i podne ploče prizemlja.

1.2 Opis nosive konstrukcije

1.2.1 Temelji

Računska nosivost tla iznosi $s_{R,d}=280 \text{ kPa}$, što je nakon iskopa temelja potrebno utvrditi ispitivanjem. Temeljne trake izvesti (visine $h=40$) izvesti od betona C30/37, armirati s B-500. Nadtemeljne zidove ($d=25 \text{ cm}$) i podnu ploču ($d=15 \text{ cm}$) izvesti od betona C30/37, armirati s B-500.

1.2.2 Zidovi

Nosive zidove zidati od blok opeke u vapneno-cementnom mortu (mort opće namjene). Zidovi su debljine $t=25 \text{ cm}$, a omeđeni su vertikalnim i horizontalnim serklažima. Svojstva blok opeke i morta:

Grupa zidnih elemenata: 2

Srednja tlačna čvrstoća bloka: $f_{b,min}=8.0 \text{ N/mm}^2$

Razred izvedbe: 2; zidni elementi kategorije I., propisani mort (mort zadanog sastava). Za zidanje rabiti produžni mort marke M5 ($f_m=5.0 \text{ N/mm}^2$), kojemu odgovara slijedeći volumni sastav:

cement : hidratizirano vapno : pijesak = $1 : (\frac{1}{2} - \frac{1}{4}) : (5 - 6)$

Obvezno je popunjavanje mortom horizontalnih i uspravnih sljubnica između zidnih blokova. Po procjeni nadzornog inženjera utvrditi će se potreba za ispitivanjem tlačne čvrstoće morta.

1.2.3 Međukatne konstrukcije

Međukatnu konstrukciju iznad 1. etaže izvesti kao a-b ploču debljine 15 cm, od betona C30/37 i armirati s B-500. Horizontalne serklaže ($b/h=25/25$ cm) izvesti zajedno s pločom, od betona C25/30 i armirati s B-500.

Međukatnu konstrukciju iznad 2. i 3. etaže izvesti kao sitnorebrasti stropni sustav s prednapregnutim gredicama (osni razmak 60 cm) i opečnih blokova ispune ($h=16$ cm), monolitiziranu tlačnom a-b pločom ($d=6$ cm) armiranu s Q-188. Ukupna debljina konstrukcije je $d=22.0$ cm. Horizontalne serklaže izvesti u razini međukatnih konstrukcija od betona C25/30 i armirati s B-500.

Međukatnu konstrukciju iznad 4. etaže izraditi kao lakobetonsku roštiljnu konstrukciju - Bijeli strop, koju čine a-b gredice na osnom razmaku od 65 cm s ispunom od porobetonskih blokova. Osnovnu armaturu gredica čini dvostruki rešetkasti nosač 7/7/4 mm čvrstoće čelika B-500 i šipkasta armatura B-500, odredena proračunom. Poprečna rebra izvesti na osnom razmaku min. 104 cm (4 reda ispuna), širine 4 cm i armirati s po $\Phi 10$ u gornjoj i donjoj zoni. Konstrukciju monolitizirati ispunjavanjem rebara glavnih i poprečnih nosača sitnozrnim betonom C25/30, a dan nakon cijelu gornju krovnu plohu zaliti rijetkom smjesom tankoslojnog morta i cementa u omjeru 1:1.

1.2.4 Ostale konstrukcije

Vertikalne i horizontalne serklaže izvesti od betona C25/30 i armirati s B-500.

Sve vertikalne serklaže izbetonirati nakon zidanja ziđa. Moguće je ugraditi posebne blokove koji oblikuju oplatu serklaža. Horizontalne serklaže izvesti u razini međukatnih konstrukcija od betona C25/30 i armirati s B-500.

3.2.1 Proračun ukupne potresne poprečne sile

Ukupna potresna poprečna sila iznosi:

$$F_b = \gamma_I * S_d(T_1) * W$$

gdje je:

$S_d(T_1)$ = ordinata računskog spektra za period T_1

γ_I – faktor važnosti građevine ($\gamma_I=1.0$)

$S_d(T_1) = a * S * 2.5 / q$

$a = a_g / g = 2.0 / 10 = 0.2$; $S = 1.2$ (B kategorija tla)

$q = 2.5$ (faktor ponašanja konstrukcije)

$S_d(T_1) = 0.2 * 1.2 * 2.5 / 2.5 = 0.24$

W = računska težina zgrade:

$$\text{grede i nadvoji 400: } b * h * L_{uk} * \gamma_c = 0.25 * 0.25 * 100.0 * 25.0 = 156 \text{ kN}$$

$$W_1 = 1787 \text{ kN}$$

Izračun težina skoncentriranih u razini međukatnih konstrukcija:

$$W_{400} = W_4 = 1520 \text{ kN}$$

$$W_{200} = W_2 = 1637 \text{ kN}$$

tlačna čvrstoća ziđa: $f_k = K \times f_b^{0.7} \times f_m^{0.3} = 0.45 * 9.2^{0.7} * 5.0^{0.3} = 3.45 \text{ MPa}$

parcijalni koef. sigurnosti za materijale: $\gamma_M = 1.5$

karakteristična posmična čvrstoća: $f_{vk} = f_{vk0} + 0.4 \times \sigma_d =$

$$f_{vk} < 0.065 \times f_b = 0.065 * 9.2 = 0.60 \text{ MPa}$$

U proračunu zidova na potres dokazuje se da je:

$$1/ \quad V_{Sd} < V_{Rd}$$

računska poprečna sila: V_{Sd} računska nosivost na poprečnu silu:

$$V_{Rd} = A \times f_{vk}/\gamma_M = x_u \times t \times f_{vk}/\gamma_M$$

$$2/ \quad F_d < F_{Rd}$$

$$F_d = M_{Sd} / z + N_{Sd} / 2$$

računska uzdužna sila: $N_{Sd} = (N_g + N_q * \Psi_{2i})$

računski moment savijanja: M_{Sd}

z = krak unutarnjih sila; $z \approx 0.8 * d$

računska nosivost na tlačnu sili na rubu:

$$F_{Rd} = x_u \times t \times f_k/\gamma_m$$

$$x_u = 2(d-z) \approx 0.4 * d$$

$$\gamma_m = 1.5$$

Potrebna površina armature vertikalnih serklaža:
