Diplomski rad

Split,2019.

Projekt konstrukcije čeličnog krova industrijske hale

Sažetak:

Tema ovog diplomskoga rada je proračunati glavne elemente čeličnog krova industrijske hale. Glavna nosiva konstrukcija se sastoji od višedjelnih čeličnih IPE profila (saćasti nosači) postavljenih na osnom razmaku od 3.35 m, a sekundarna konstrukcija od standardnih IPE nosača postavljenih na osnom razmaku od 2,0 m. Projekt se izvodi za halu tlocrtnih dimenzija 30.45 x 12.10 m sa jednostrešnim krovom nagiba 7%. Visina hale u strehi iznosi 5.0 m, a u sljemenu 5.85 m. Analiza konstrukcije je provedena računalnim programima SCIA engineer 2018 i ArceloMittal software Angelina. Zbog kompleksnosti samih saćastih profila, te zbog toga što im svojstva poprečnog presjeka nisu jednoznačno definirana, posebna pozornost u projektu je posvećena izradi modela glavnog nosivog sustava krovišta. Jednostavnim postupcima rezanja i ponovnog zavarivanja od standardnih vrućevaljanih profila dobivaju se nosači koji imaju moment tromosti veći do 100% i moment otpora veći od 50% uz isti utrošak materijala, odnosno istu vlastitu težinu. Povećanje otpornosti saćastih nosača je nešto manje, ali ipak znatno u odnosu na profil od kojeg su dobiveni. Na kraju se može zaključiti da je kompleksnost izvedbe saćastih nosača znatno manja od prednosti koju ovakvi nosači pružaju te njihova primjena može biti racionalnija od primjene odgovarajućih valjanih ili zavarenih profila. Nakon dimenzioniranja nosivih elemenata pristupilo se oblikovanju i proračunu spoja stup-greda. U zadnjoj fazi izrađeni su odgovarajući nacrti konstrukcije te nacrti detalja spoja. Svi elementi su dimenzionirani prema HRN EN 1993, a korisno opterećenje prema HRN EN 1991. Diplomski rad je izrađen na razini izvedbenog projekta.

Ključne riječi:

Industrijska hala, saćasti nosači, spoj stup-greda

Design of the steel roof for industrial building

Abstract:

This thesis presents a design of main elements in the steel roof of an industrial hall. The main load bearing elements are steel IPE profiles (castellated beams) spaced every 3.35m apart, while the secondary elements are standard IPE girders, spaced every 2m. Design was carried out for a rectangular hall with dimensions 30.45 x 12.10m, with one-sided roof with inclination of 7%. Height of the ridge of the structure is 5.85m, while height of the eave is 5.0m. Numerical modeling and structural analysis of the building was performed in SCIA engineer 2008 and ArceloMittal software. Special attention was paid to the making of an accurate model, due to complexity of castellated beams and theirs not uniform geometry. By using simple technique of cutting and then welding of standard hot rolled profiles, it is possible to obtain the girders with increase in moment of inertia up to 100% and moment of resistance up to 50%, with the same costs in terms of material and with the same self-weight. The enhancement in strength of castellated beams is lower, but still significant comparing with the elements that were used for their production. In conclusion, the complex execution of castellated beam is justified by plenty of advantages, since it is more rational to use them than similar rolled or welded profiles. After design of load bearing elements, connection between column and beam was calculated. Finally, detailed drawings of structure and of joints were done in AutoCAD software. Structural elements were designed according to HRN EN 1993, while loads were obtained from HRN EN 1991.

Keywords:

ZADATAK ZA DIPLOMSKI RAD

Tema: Projekt konstrukcije čeličnog krova industrijske hale

Opis zadatka:

Zadatak diplomskoga rada je projektiranje konstrukcije čeličnog krova industrijske hale pomoću višedjelnih čeličnih greda (saćastih nosača). Predmetna građevina se nalazi na otoku Braču iznad mjesta Selca, tlocrtne dimenzije su 30,45 x 12,10 m sa jednostrešnim krovištem nagiba 7%. Visina konstrukcije u strehi je 5.0 m, a u sljemenu 5.85 m. Potrebno je izraditi model glavnog nosivog elementa konstrukcije krova primjenom sustava saćastih nosača, dimenzionirati elemete te izvršiti proračun spoja stup-greda. Treba napraviti usporedbu između nosivog sustava od standardnih valjanih nosača te nosivog sustava od saćastih nosača. Također je potrebno izraditi pripadajuće nacrte uz iskaz količine materijala za pojedine elemente. Proračun je potrebno provoditi u skladu sa HRN EN 1991 te HRN EN 1993.

Zahvaljujem mentoru Dr.sc. Vladimiru Diviću
na pomoći i savjetima pri pisanju ovoga rada,
a posebno se zahvaljujem mojoj obitelji
na strpljenju i podršci tijekom studiranja.

SADRŽAJ :

1. TEHNIČKI OPIS

1.1 Opis konstrukcije

Predmet ovog projekta je proračun čelične konstrukcije krovišta industrijske hale. Predmetna građevina nalazi se na području otoka Brača iznad mjesta Selca. Tlocrtne dimenzije građevine, koje se odnose na osi glavne nosive konstrukcije, iznose 30,45 x 12,10 m. Visina konstrukcije u bočnom poprečnom presjeku iznosi 5,85 m iznad kote tla, dok niža visina iznosi 5,0 m. Krovna ploha je u odnosu na horizontalnu ravninu nagnuta pod kutem od α = 4,00°, što je ekvivalentno nagibu od 7%. Predviđena je krovna konstrukcija sa pokrovom od sendvič panela na koju se proračunava mogućnost postavljanja solarnih panela. Glavnu nosivu čeličnu konstrukciju krova čine saćaste nosive grede raspona 12,0 m postavljenih na osnom razmaku 3,35 m, a sastoje se od sastavljenih grednih elemenata IPE 270 profili. Sekundarnu konstrukciju čine krovne podrožnice izvedene od IPE 100 profila, koje sudjeluju u horizontalnoj stabilizaciji ravnine i preuzimanju opterećenja od krovnih i solarnih panela. Glavna nosiva konstrukcija se oslanja na armiranobetonske stupove te je detalj njihova spoja posebno proračunat i detaljno prikazan u građevinskim nacrtima.

1.2 O proračunu konstrukcije

Proračun unutarnjih sila, momenata savijanja i dimenzioniranje elemenata čelične konstrukcije provedeno je u skladu s Eurocode-om. Proračunom su obuhvaćena sva djelovanja na konstrukciju, vlastita težina, dodatno stalno opterećenje, opterećenje vjetrom te opterećenje snijegom. S obzirom na lokaciju objekta i namjenu hale, posebna pažnja posvećena je opterećenju vjetra na konstrukciju. U svrhu dimenzioniranja elemenata konstrukcije određena je mjerodavna kombinacija opterećenja za provjeru kranje graničnoga stanja i graničnoga stanja uporabljivosti. Rezultati prikazani u grafičkome dijelu projekta uključuju rezne sile i pomake određenih dijelova konstrukcije. Analiza konstrukcije provedena je računalnim programom SCIA engineer 2018 i ArceloMittal pre-design software for Angelina beam. Sve mjerodavne kombinacije su uzete u obzir, te je svaki element konstrukcije dimenzioniran u skladu njihovim reznim silama.

1.3 Materijali za izradu konstrukcije

Materijal za izradu glavne nosive konstrukcije, kao i sekundarne konstrukcije je čelik oznake Fe 510 (S 355). Svi elementi konstrukcije će se izraditi od iste kvalitete čelika, a biti će međusobno povezani zavarivanjem. Vijci korišteni za izvedbu ovog krovišta industrijske hale su M20 kvalitete 10.9. Spojevi elemenata konstrukcije uključuju dodatne pločice i ukrute, također iste kvalitete čelika. Za krovnu oblogu objekta koristimo sendvič panele vlastite težine 10 kg/m^2, od tankog profiliranog aluminijskog lima, ispunjene mineralnom (kamenom) vunom.

1.4 Primjenjeni propisi

Proračun čelične konstrukcije hale proveden je prema sljedećim propisima:

Analiza opterećenja:

Vlastita težina građevine HR EN 1991-2-1
Djelovanje snijega na konstrukciju HR EN 1991-2-3
Djelovanje vjetra na konstrukciju HR EN 1991-2-4

Dimenzioniranje čeličnih konstrukcij HR EN 1993

1.5 Antikorozivna zaštita

Svi dijelovi čelične konstrukcije moraju biti zaštićeni od korozije prema odredbama "Pravilnika o tehničkim mjerama i uvjetima za zaštitu čeličnih konstrukcije od korozije". Kao vrsta zaštite od korozije odabrana je zaštita pocinčavanjem. Ukupna debljina zaštitnog sloja usvaja se 200 µm. Svi djelovi konstrukcije se također premazuju i završnim slojem premaza. Nakon završene izvedbe svakog sloja potrebno je provjeriti debljinu i prionjivost namaza.

1.6 Protupožarna zaštita

Svi elementi konstrukcije se moraju zaštititi specijalnim premazima otpornim na visoke temperature. Industrijsku halu je potrebno opremiti protupožarnim vatrogasnim aparatima u slučaju nastanka požara. Svi vatrogasni aparati moraju biti ispravni i uredno servisirani te moraju biti postavljeni na lako dostupnim i vidljivim mjestima.

1.7 Uvijeti za izradu čelične konstrukcije

Izrada čelične konstrukcije mora se povjeriti onom izvođaču koji ima odgovarajuće reference već izvedenih sličnih elemenata konstrukcije. U tehničkoj dokumentaciji predviđena je vrsta i kvaliteta materijala od kojeg treba izraditi konstrukciju. Odstupanja u kvaliteti materijala može odobriti jedino projektant konstrukcije. Prije isporuke konstrukcije na gradilište vrši se prijem konstrukcije u radionici zajedno sa kompletnom dokumentacijom o izvedenoj kvaliteti elemenata.

1.8 Opće napomene za izradu čelične konstrukcije u radionici

Prilikom rezanja materijala treba paziti na mogućnost pojave lokalnih zareza. Svaki uočeni zarez potrebno je izbrusiti ili dovariti i izbrusiti. Svi elementi trebaju biti izrađeni u granicama dopuštenih odstupanja. Premaše li odstupanja granične vrijednosti, potrebno je zatražiti suglasnost projektanta na izvedeno stanje. Kod zavarivačkih radova potrebno je osigurati stalnu kontrolu prije, u toku i nakon izvedenih radova. Poslije izvedenih radova potrebno je obaviti vizualnu i dimenzionalnu kontrolu te kontrole predviđene projektom. Prilikom izvođenja zavarivačkih radova potrebno je voditi računa da konstrukcija u fazi hlađenja ne poprimi nepovoljni deformirani oblik. Ne dopušta se zavarivanje na temperaturi nižoj od 0 ^{o}C.

2 ANALIZA OPTEREĆENJA

2.1 Stalno djelovanje

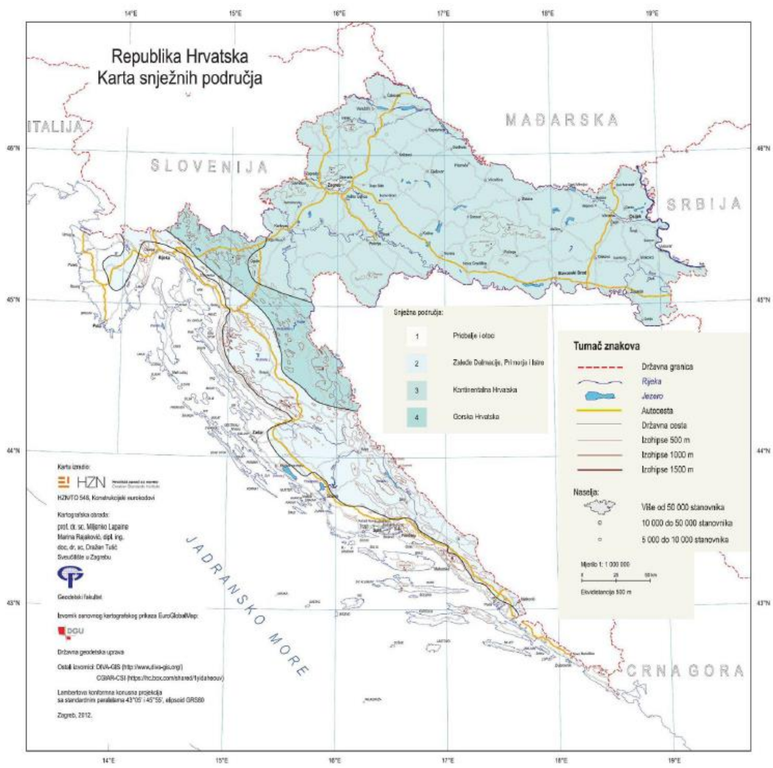
- Solarni paneli..0,20 kN/m^2
- Sendvič paneli (aluminij) ....0,10 kN/m^2
- Sekundarna krovna konstrukcija ....0,08 kN/m^2
- Instalacije ....0,02 kN/m^2

$\sum$ = 0,40 kN/m^2

2.2 Djelovanje snijega

Za lokaciju građevine u zoni I iz karte klimatskih zona karakterističnog opterećenja snijegom,za nadmorsku visinu od 0-100 m, očitana je karakteristična vrijednost opterećenja snijega na tlu:

Sk= 0,50kN/m2



Slika 1: Karta opterećenja snijegom za RH

Nadmorska visina do [m]	1. područje – priobalje i otoci [kN/m²]	2. područje – zaleđe Dalmacije, Primorja i Istre [kN/m²]	3. područje – kontinentalna Hrvatska [kN/m²]	4. područje – gorska Hrvatska [kN/m²]
100	0,50	0,75	1,00	1,25
200	0,50	0,75	1,25	1,50
300	0,50	0,75	1,50	1,75
400	0,50	1,00	1,75	2,00
500	0,50	1,25	2,00	2,50
600	0,50	1,50	2,25	3,00
700	0,50	2,00	2,50	3,50
800	0,50	2,50	2,75	4,00
900	1,00	3,00	3,00	4,50
1 000	2,00	4,00	3,50	5,00

1 400	6,00	8,00		8,00
1 500		9,00		9,00
1 600		10,00		10,00
1 700		11,00		11,00
1 800		12,00		

Tablica 1: Opterećenje snijegom za snježna područja i pripadajuće nadmorske visine

Opterećenje snijegom na krovu „s":

$$s = s_k \cdot \mu_i \cdot C_e \cdot C_t$$

gdje je:

μ_i = 0,8 (koeficijent oblika za kut nagiba krova: 0° < 4° < 30°)

C_e = 1,0 (koeficijent izloženosti)

C_t = 1,0 (temperaturni koeficijent)

$$s = s_k \cdot \mu_i \cdot C_e \cdot C_t = 0,50 \cdot 0,8 \cdot 1,0 \cdot 1,0 = 0,40\ kN/m^2$$

2.3 Djelovanje vjetra

- pritisak vjetra na vanjske površine: $w_e = q_p * c_e(z_e) * c_{pe}$ [kN/m²]

- pritisak vjetra na unutarnje površine: $w_i = q_p * c_e(z_i) * c_{pi}$ [kN/m²]

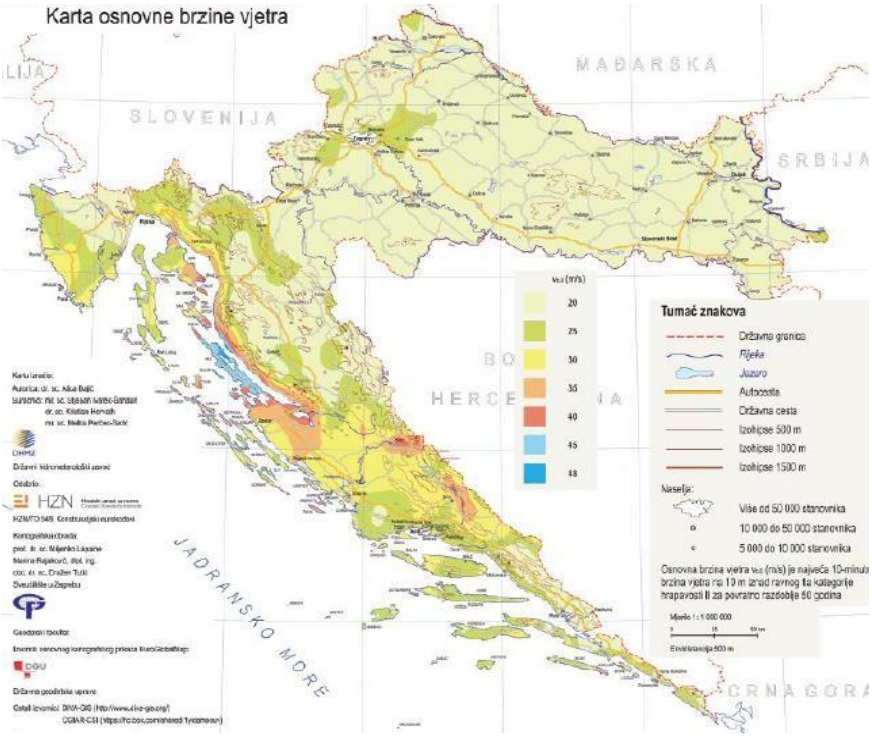
Gdje je:

q ref – poredbeni tlak vjetra pri srednjoj brzini vjetra

Ce(ze);Ce(zi) – koeficijenti izloženosti koji uzimaju u obzir neravnine terena

ze;zi – poredbene visine za lokalni ili unutarnji tlak

cpe;cpi – vanjski i unutarnji koeficijent pritiska



Slika 2: Prikaz karte osnovnih brzina vjetra za RH

$q_b = \frac{1}{2} \cdot \rho \cdot v_b^2$ [kN/m²]

gdje je:

v_b – osnovna brzina vjetra

ρ – gustoća zraka (ρ=1,25 kg/m^3)

Osnovna brzina vjetra v_b ,dana je izrazom:

$v_b = c_{dir} * c_{season} * v_{b0}$

gdje je:

v_b – osnovna brzina vjetra

c_{dir} – koeficijent smjera vjetra (obično uzima vrijednost 1,0)

c_{season} – koeficijent ovisan o godišnjem dobu (obično uzima vrijednost 1,0)

Osnovni pritisak vjetra:

$v_b = 30\ m/s$ - očitano za otok Brač

$c_{dir} \cdot c_{season} = 1.0$

$v_b = v_{b,0} \cdot C_{dir} \cdot C_{season} = 30 \cdot 1.0 \cdot 1.0 = 30.0\ m/s$

$\rho = 1.25\ kg/m^3$

$$q_b = \frac{\rho}{2} \cdot v_b^2 = \frac{1,25}{2} \cdot 30,0^2 = 562,5,4(N/m^2) = 0,56(kN/m^2)$$

Faktor terena k_r -za kategoriju terena II (Područja s niskom vegetacijom i izoliranim preprekama):

$$\mathrm{k_r} = 0,19 \cdot \left(\frac{\mathrm{z_0}}{\mathrm{z_{0,II}}}\right)^{0,07} = 0,19 \cdot \left(\frac{0,05}{0,05}\right)^{0,07} = 0,19$$

$$\mathrm{C_{r(z)}} = \mathrm{k_r} \cdot \ln\left(\frac{\mathrm{z}}{\mathrm{z_0}}\right) = 0,19 \cdot \ln\left(\frac{5,36}{0,05}\right) = 0,89$$

$C_{0(z)} = 1{,}0$

<u>Srednja brzina vjetra iznad terena:</u>

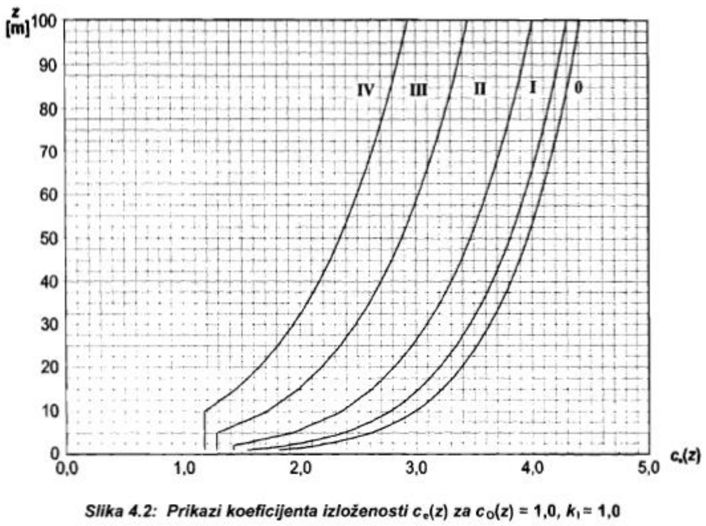
$v_m = v_b \cdot C_{r(z)} \cdot C_{0(z)} = 30 \cdot 0.89 \cdot 1.0 = 26.65\ m/s$

<u>Intezitet turbulencije:</u>

$$I_{v(z)} = \frac{k_I}{C_{0(z)} \cdot \ln\left(\frac{z}{z_0}\right)} = \frac{1}{1 \cdot \ln\left(\frac{5{,}36}{0{,}05}\right)} = 0{,}213$$

<u>Pritisak brzine vjetra pri udaru:</u>

$q_{p(z)} = \left[1 + 7 \cdot I_{v(z)}\right] \cdot 0{,}5 \cdot \rho \cdot v_m^2$=$[1 + 7 \cdot 0{,}213] \cdot 0{,}5 \cdot 1{,}25 \cdot 26{,}65^2 \cdot 10^{-3}$ =11,05 kN/m^2



Slika 3: Prikazi koeficijenata izloženosti

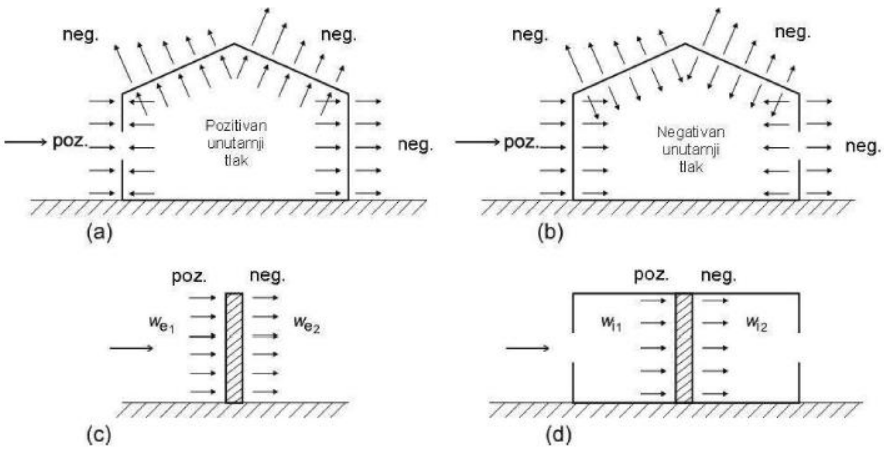
$C_{e(z)}$=2,0 -očitani faktor izloženosti

q_b je tlak pri osnovnoj brzini i on se moze dobiti kao: $q_b = \frac{1}{2}\rho v_b^2$, što daje vrijednost od 0.56 kN/m2.

$q_p(z) = 2 * 0.56 = 1.12\ kN/m2.$

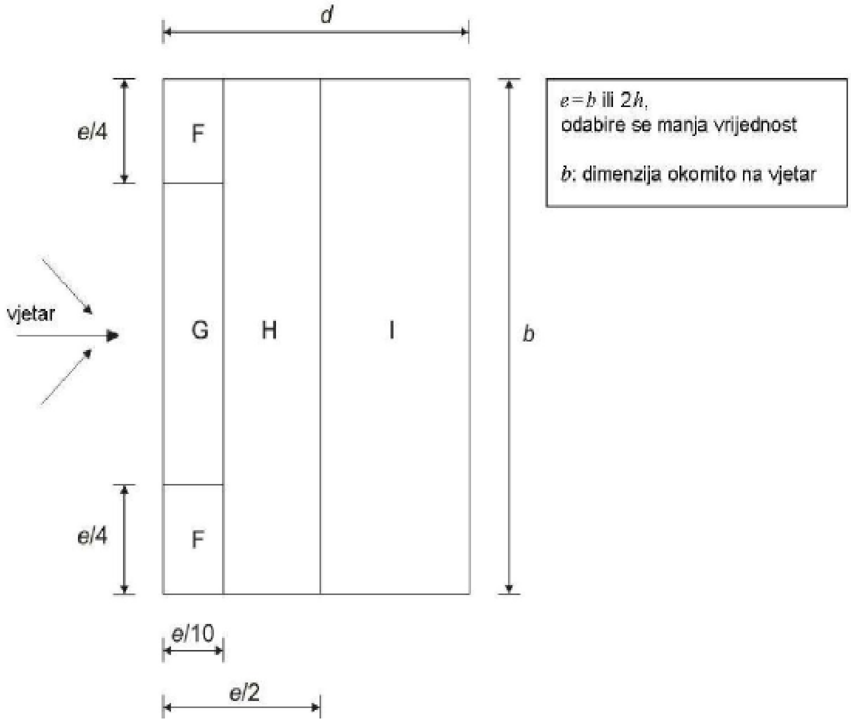
Pritisak vjetra na vanjske površine: we = qp*ce(ze)*cpe [kN/m^2]

Pritisak vjetra na unutarnje površine: wi = qp*ce(zi)*cpi [kN/m^2]



Slika 4: Tlak na površine

Odabrani koeficijenti tlaka su za ravne krovove. Ravni krovovi su definirani kao ravni ako imaju kosinu izmedju $-5º < \alpha < 5º$. Razliciti koeficijenti tlaka su definirani za svako podrucje.



Slika 5 : Legenda za ravne krovove

Vrsta krova	Područje							
	F		G		H		I	
	$c_{pe,10}$	$c_{pe,1}$	$c_{pe,10}$	$c_{pe,1}$	$c_{pe,10}$	$c_{pe,1}$	$c_{pe,10}$	$c_{pe,1}$

3 GLAVNA NOSIVA KONSTRUKCIJA

3.1 Odabir IPE profila glavne nosive konstrukcije krova

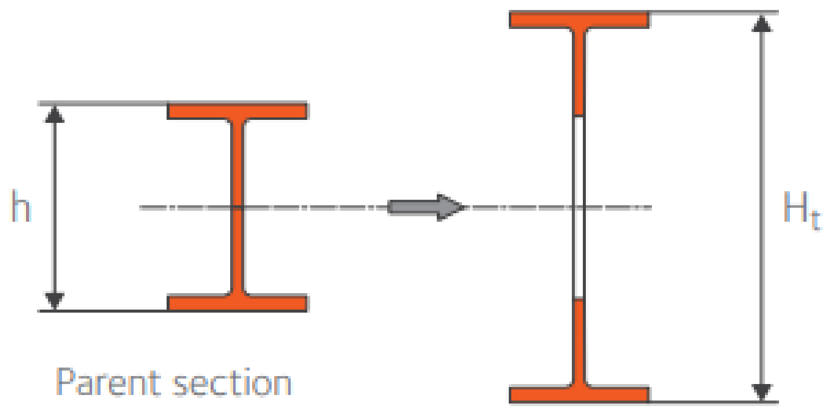
Svi saćasti IPE profili su jednake duljine (12,00 m) i jednake kvalitete čelika (S355) Kod odabira odgovarajućeg IPE profila najveću važnost pridodajemo nosivosti, težini samih elemenata, jednostavnosti izrade u postrojenju i jednostavnosti montaže na samome gradilištu. Duljina rezanja i duljina zavara najviše utječu na jednostavnost izrade pojedinog elementa, a samim time i utječu na konačnu ukupnu cijenu svih elemenata.

Oznaka	Masa (kg)	Površina rezanja (cm2)	Duljina zavara (cm)	Broj polja
IPE 220	317	709	1202	11
IPE 240	371	744	1200,8	10
IPE 270	436	793	1201,2	9
IPE 300	511	852	1200,8	8

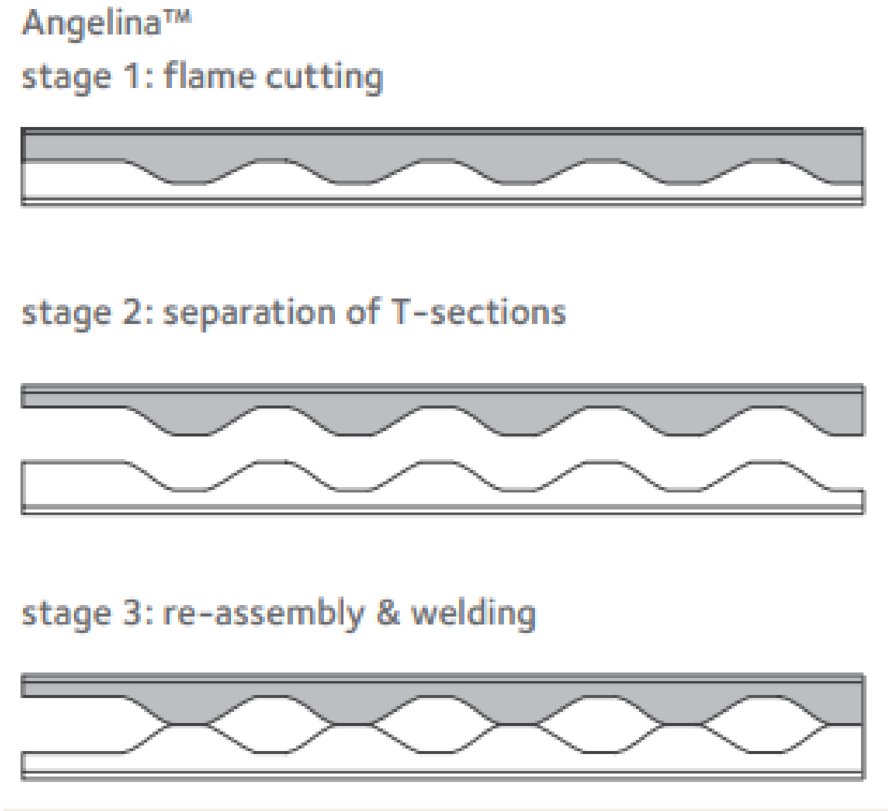
U obzir su uzeta četiri saćasta nosača, te je svaki posebno dimenzioniran.

3.2 Način izvedbe glavne nosive konstrukcije

Kod izvedbe sustava nosača "Angelina" koristi se standardan IPE profil koji se posebnim rezom hrpta reže te naknadno sastavlja. Prednosti ovog načina izvedbe je povećanje statičke visine standardnog IPE profila uz istu masu, mogućnost provođenja instalacija te sam estetski izgled.



Slika 6 : Povećanje statičke visine IPE nosača



Slika 7 : Sustav greda "Angelina"

3.3 Dimenzionirnje nosača

3.3.1. Saćasti nosač IPE 220

ULTIMATE LIMIT STATES (ULS)

Note: the calculation method applies to steel rolled profiles only.

Summary of the criteria

S = Satisfactory NS = Not satisfactory

Checkings of net sections at openings

Resistance to shear force (Open. no 1 - Comb. U5) : $\Gamma_{V,max}$ = 0.182 < 1 S
Resistance to M+N interaction (Open. no 7 - Comb. U5) : $\Gamma_{MN,max}$ = **1.051** **> 1** **NS**
Resistance to M+N+V interaction (Open. no 7 - Comb. U5) : $\Gamma_{MNV,max}$ = **1.051** **> 1** **NS**

Web checkings

Shear buckling check required (Post no 1 - Comb. U5) : $\Gamma_{Vbw,max}$ = 0.081 < 1 S

Posts checkings

Resistance to shear (Post no 1 - Comb. U5) : $\Gamma_{Vh,max}$ = 0.287 < 1 S
Minimum throat thickness
Intermediate posts (Post no 1 - Comb. U5) : a_{min} = 0.94 mm
Warning: the throat thickness is assessed by assuming two welds
The total thickness of welds should be at least 1.87 mm
End posts (Post no 11 - Comb. U5) : a_{min} = 0.59 mm
The calculation for end posts does not take into account the details of the joint

Warning : the throat thickness of the fillet weld must be at least 3 mm (EC3)

Gross sections checkings

Resistance to bending (Post no 6 - Comb. U5) : $\Gamma_{Mg,max}$ = 0.772 (Classe 1) < 1 S
Resistance to shear (Left end - Comb. U5) : $\Gamma_{Vg,max}$ = 0.096 < 1 S

Other checkings

Resistance to lateral torsional buckling $\Gamma_{LT,max}$ = **28.400** **> 1** **NS**

Force and moment in the post	$V_{h,Ed}$	=	117.5 kN	$M_{h,Ed}$	=	0.0 kNm
Partial factor	γ_{M2}	=	1.25			
Throat thickness	a	=	0.936 mm			

Warning: the throat thickness is assessed by assuming two welds
The total thickness of welds should be at least 1.87 mm

SERVICEABILITY LIMIT STATES (SLS)

Deflections

v : Maximum vertical deflection of the beam

Under elementary load cases

Permanent loads (G) :	v = 6.07 mm (S13)	= L / 1978
Live loads 1 (Q1) :	v = 62.76 mm (S13)	= L / 191
Live loads 2 (Q2) :	v = -180.1 mm (S13)	= L / 67

Under SLS Combinations

S1 = 1.00 G + 1.00 Q1 :	v = 68.8 mm (S13)	= L / 174

The user has to check whether the deflections are acceptable according to the project requirements and to consider a precambering if necessary.

Natural frequencies

Load case / Combination	Mass assumed to be concentrated	Mass assumed to be distributed
G	6.41Hz	7.31Hz
G + 0.1 Q1	4.50Hz	5.12Hz
G + 0.2 Q1	3.66Hz	4.17Hz
G + 0.3 Q1	3.17Hz	3.61Hz
G + 0.4 Q1	2.83Hz	3.22Hz
G + 0.5 Q1	2.58Hz	2.94Hz

3.3.2 Saćasti nosač IPE 240

IPE 240

Parameters

General Parameters

Non composite Beam

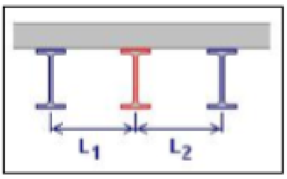
End supports :	Simply supported beam
Horizontal span length :	L = 12.00 m
Total number of openings :	n = 10
Dimensions of the openings :	
Height :	a_0 = 220.0 mm
Length of the sinusoide :	s = 300.0 mm
Length of the flat part :	w_o = 280.0 mm
Web post width :	$w_p = w_o$ = 280.0 mm
Spacing between openings center :	$e = 2\ s + w_o + w_p$ =1160 mm
End web posts widths :	$w_{end,l}$ = 340.0 mm $w_{end,r}$ = 340.0 mm
Mass :	m = 371 kg
Total paint surface :	S = 12.43 m^2
Paint surface (without upper face) :	S' = 10.99 m^2
Massiveness :	M = 263.20 m^{-1}
Massiveness (without upper face) :	M' = 232.70 m^{-1}

Checking of the ANGELINA scope

Spacing cutting / flange inner face :	d = 55.20 mm	≥ 50.00 mm	OK
Spacing cutting / web-flange root :	d = 40.20 mm	≥ 10.00 mm	OK
Dimensions of an opening :	(2b+w)/a = 4.00	≤ 5.00	OK
Web slenderness :	h_w / t_w = 48.45	≤ 124.0ε_w = 100.9	OK

Position of the beam

The studied beam is an intermediate beam.



Spacing of the beam	- to the adjacent left beam :	L_1 = 3.350 m
	- to the adjacent rigth beam :	L_2 = 3.350 m

Width for the calculation of the surface loads supported by the beam :

on the left side :	d_1 = 1.675 m
on the right side :	d_2 = 1.675 m
Total width :	$d_1 + d_2$ = 3.350 m

Lateral restraint

Concentrated lateral restraints :

	x (m)	Lateral restraints	
1	0.0	Both flanges	Origin section
2	12.00	Both flanges	End section

ULTIMATE LIMIT STATES (ULS)

Note: the calculation method applies to steel rolled profiles only.

Summary of the criteria

S = Satisfactory NS = Not satisfactory

Checkings of net sections at openings

Resistance to shear force (Open. no 10 - Comb. U5) :	$\Gamma_{V,max}$	= 0.147	< 1	S
Resistance to M+N interaction (Open. no 4 - Comb. U5) :	$\Gamma_{MN,max}$	= 0.725	< 1	S
Resistance to M+N+V interaction (Open. no 4 - Comb. U5) :	$\Gamma_{MNV,max}$	= 0.725	< 1	S

Web checkings

Shear buckling check required (Post no 1 - Comb. U5) :	$\Gamma_{Vbw,max}$	= 0.072	< 1	S

Posts checkings

Resistance to shear (Post no 1 - Comb. U5) : $\Gamma_{Vh,max}$ = 0.254 < 1 S

Minimum throat thickness

Intermediate posts (Post no 1 - Comb. U5) : a_{min} = 0.87 mm

Warning: the throat thickness is assessed by assuming two welds

The total thickness of welds should be at least 1.74 mm

End posts (Post no 10 - Comb. U5) : a_{min} = 0.64 mm

The calculation for end posts does not take into account the details of the joint

Warning : the throat thickness of the fillet weld must be at least 3 mm (EC3)

Gross sections checkings

Resistance to bending (Post no 5 - Comb. U5) :	$\Gamma_{Mg,max}$	= 0.600 (Classe 1)	< 1	S
Resistance to shear (Left end - Comb. U5) :	$\Gamma_{Vg,max}$	= 0.080	< 1	S

Other checkings

Resistance to lateral torsional buckling	$\Gamma_{LT,max}$	= **18.534**	**> 1**	**NS**

ULS Combinations checkings

ULS Combination U1 **U1 = 1.35 G + 1.50 Q1 + 1.05 Q2**

Horizontal shear force in post	V_{hm}	=	-117.6 kN			
In adjacent openings:	$\Gamma_{N,max}$	=	0.372			
Extra resistance parameters	Ω	=	1.214	χ	=	1.000
	ξ	=	0.186	β	=	0.524
Intermediate post - Extra resistance				η	=	1.300
Post width	w	=	280.0 mm			
Resistant shear forces	V_{hRd}	=	462.55 kN			
Checkings	Γ_{Vh}	=	0.254			

Bending resistance of gross sections

Section at web post no 5 (Section no 12) - Combination U5

Internal moment and force	M_{Ed}	=	-127.96 kNm	N_{Ed}	=	0.00 kN
Lower flange under compression:	Class 1					
Class of the web						
Steel	$f_{y,w}$	=	355 MPa	ε_w	=	0.814
Slenderness:	c / t	=	48.45			
Plastic distribution factor	α	=	0.50			
Class of the web	1					
Check of the resistance (Class1)						
Steel	$f_{y,top}$	=	355 MPa	$f_{y,bot}$	=	355 MPa
Partial factor	γ_{M0}	=	1.00			
Plastic resistant moment	$M_{pl,Rd}$	=	213.19 kNm			
Check	Γ_{Mg}	=	0.600			

Shear resistance of gross sections

Section at left end (Section no 1) - Combination U5

Height of the cross-section	h	=	350.0 mm			
Shear area	$A_{v,top}$	=	1298.2 mm²	$A_{v,bot}$	=	1298.2 mm²
Yield strengths	$f_{y,top}$	=	355 MPa	$f_{y,bot}$	=	355 MPa
Shear design force	V_{Ed}	=	42.65 kN			
Shear resistance force	V_{plRd}	=	532.15 kN	γ_{M0}	=	1.00
Check	Γ_{Vg}	=	0.080			

Resistance to lateral torsional buckling

Combination U5
Check of lower flange
Part between sections laterally maintained in x = 0.0 m and x = 12.00 m

Length of the part	L	=	12.00 m			
Moments at ends	$M_{end,l}$	=	0.00 kNm	$M_{end,r}$	=	0.00 kNm
Maximum moment	M_{Ed}	=	127.96 kNm			
Maximum normal force in chord	N_{Ed}	=	389.52 kN			
Properties of the chord section	A_0	=	1614.8 mm²	$I_{z,0}$	=	141.6 cm⁴
Yielding strength	f_y	=	355 MPa			
Height of the tee	h_{Te}	=	65.0 mm			
Isostatic moment distribution	C_1	=	1.132			
Critical normal force	N_{cr}	=	23.08 kN			

Reduced slenderness	λ_b	=	4.984
Reduction factor (curve "c")	χ	=	0.037
Partial factor	γ_{M1}	=	1.000
Resistant normal force	$N_{b,Rd}$	=	21.02 kN
Check	Γ_{LT}	=	18.534

Minimal throat thickness at post no 1

Combination U5

Width of the post	w	=	280.0 mm			
Ultimate strength	f_u	=	470.0 MPa	β_w	=	0.90
Moments at openings sections	$M_{Ed,l}$	=	-31.11 kNm	$M_{Ed,r}$	=	-69.37 kNm
Spacings between tee chords	$d_{G,l}$	=	325.4 mm	$d_{G,r}$	=	325.4 mm
Axial forces in lower chords	$N_{m,Ed,l}$	=	-95.59 kN	$N_{m,Ed,r}$	=	-213.2 kN
Force and moment in the post	$V_{h,Ed}$	=	117.6 kN	$M_{h,Ed}$	=	0.0 kNm
Partial factor	γ_{M2}	=	1.25			
Throat thickness	a	=	0.870 mm			

Warning: the throat thickness is assessed by assuming two welds
The total thickness of welds should be at least 1.74 mm

SERVICEABILITY LIMIT STATES (SLS)

Deflections

v : Maximum vertical deflection of the beam

Under elementary load cases

Permanent loads (G) :	v = 5.14 mm (S12)	= L / 2337
Live loads 1 (Q1) :	v = 45.42 mm (S12)	= L / 264
Live loads 2 (Q2) :	v = -130.4 mm (S12)	= L / 92

Under SLS Combinations

S1 = 1.00 G + 1.00 Q1 :	v = 50.6 mm (S12)	= L / 237

The user has to check whether the deflections are acceptable according to the project requirements and to consider a precambering if necessary.

Natural frequencies

Load case / Combination	Mass assumed to be concentrated	Mass assumed to be distributed
G	6.97Hz	7.94Hz
G + 0.1 Q1	5.08Hz	5.79Hz
G + 0.2 Q1	4.19Hz	4.77Hz
G + 0.3 Q1	3.65Hz	4.16Hz
G + 0.4 Q1	3.27Hz	3.73Hz
G + 0.5 Q1	2.99Hz	3.41Hz

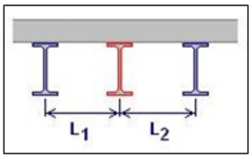
End web posts widths :	$w_{end,l} = 400.0$ mm $w_{end,r} = 400.0$ mm
Mass :	$m = 436$ kg
Total paint surface :	$S = 14.11\ m^2$
Paint surface (without upper face) :	$S' = 12.49\ m^2$
Massiveness :	$M = 254.11\ m^{-1}$
Massiveness (without upper face) :	$M' = 224.95\ m^{-1}$

Checking of the ANGELINA scope

Spacing cutting / flange inner face :	$d = 59.80$ mm	$\geq$ 50.00 mm	OK
Spacing cutting / web-flange root :	$d = 44.80$ mm	$\geq$ 10.00 mm	OK
Dimensions of an opening :	$(2b+w)/a = 3.69$	≤ 5.00	OK
Web slenderness :	$h_w\ /\ t_w = 52.97$	$\leq 124.0_{\varepsilon w} = 100.9$	OK

Position of the beam

The studied beam is an intermediate beam.



Spacing of the beam - to the adjacent left beam : L_1 = 3.350 m
- to the adjacent rigth beam : L_2 = 3.350 m

Width for the calculation of the surface loads supported by the beam :

on the left side : d_1 = 1.675 m

on the right side : d_2 = 1.675 m

Total width : $d_1 + d_2$ = 3.350 m

Lateral restraint

Concentrated lateral restraints :

	x (m)	Lateral restraints	
1	0.0	Both flanges	Origin section
2	12.00	Both flanges	End section

Cross-section

	Upper chord	Lower chord

Ultimate Limit States

U1 =	1.35 G	+ 1.50 Q1	+ 1.05 Q2
U5 =	1.35 G	+ 1.50 Q1	+ 1.50 Q2

Serviceability Limit States S1 = 1.00 G + 1.00 Q1

Load cases

Permanent loads (G)

Dead load : 0.36 kN/m
Arising from : Mass of the steel beam : 436 kg
Reactions at supports : Left end : R_{Av} = 2.14 kN
Right end : R_{Bv} = 2.14 kN

Live loads 1 (Q1)

Psi factor $\psi_0 = 0.70$

Distributed loads :

	Location x_1 (m)	Intensity q_1 (kN/m)	Location x_2 (m)	Intensity q_2 (kN/m)	Orientation
1	0.0	1.340	12.00	1.340	Vertical
2	0.0	1.340	12.00	1.340	Vertical

Reactions at supports : Left end : R_{Av} = 16.08 kN
Right end : R_{Bv} = 16.08 kN

W (Q2)

Psi factor $\psi_0 = 0.70$

Distributed loads :

	Location x_1 (m)	Intensity q_1 (kN/m)	Location x_2 (m)	Intensity q_2 (kN/m)	Orientation
1	0.0	-7.692	12.00	-7.692	Vertical

Reactions at supports : Left end : R_{Av} = -46.15 kN
Right end : R_{Bv} = -46.15 kN

Partial factors

Factors on the loads :

$\gamma_{G.sup} = 1.350$
$\gamma_{G.inf} = 1.000$
$\gamma_Q = 1.500$

Factors on the resistance :

$\gamma_{M0} = 1.000$
$\gamma_{M1} = 1.000$
$\gamma_{M2} = 1.250$
$\gamma_{M,fi} = 1.000$

ULTIMATE LIMIT STATES (ULS)

Note: the calculation method applies to steel rolled profiles only.

Summary of the criteria

S = Satisfactory NS = Not satisfactory

Checkings of net sections at openings

Resistance to shear force (Open. no 9 - Comb. U5) :	$_{V,max}$ = 0.130	< 1	S
Resistance to M+N interaction (Open. no 9 - Comb. U5) :	$_{MN,max}$ = 0.553	< 1	S
Resistance to M+N+V interaction (Open. no 9 - Comb. U5) :	$_{MNV,max}$ = 0.553	< 1	S

Web checkings

Shear buckling check required (Post no 1 - Comb. U5) :	$_{Vbw,max}$ = 0.061	< 1	S

Posts checkings

Resistance to shear (Post no 1 - Comb. U5) :	$_{Vh,max}$ = 0.192	< 1	S

Minimum throat thickness

Intermediate posts (Post no 1 - Comb. U5) : a_{min} = 0.70 mm

Warning: the throat thickness is assessed by assuming two welds

The total thickness of welds should be at least 1.40 mm

End posts (Post no 9 - Comb. U5) : a_{min} = 0.53 mm

The calculation for end posts does not take into account the details of the joint

Warning : the throat thickness of the fillet weld must be at least 3 mm (EC3)

Gross sections checkings

Resistance to bending (Post no 5 - Comb. U5) :	$_{Mg,max}$ = 0.435 (Classe 1)	< 1	S
Resistance to shear (Left end -Comb. U5) :	$_{Vg,max}$ = 0.067	< 1	S

Other checkings

Resistance to lateral torsional buckling	**$_{LT,max}$ = 11.012**	**> 1**	**NS**

	ξ	=	0.175	β	=	0.500
Intermediate post - Extra resistance					=	1.300
Post width	w	=	320.0 mm			
Resistant shear forces	V_{hRd}	=	562.74 kN			
Checkings	$_{Vh}$	=	0.192			

Bending resistance of gross sections

Section at web post no 5 (Section no 12) - Combination U5						
Internal moment and force	M_{Ed}	=	-125.22 kNm	N_{Ed}	=	0.00 kN
Lower flange under compression:	Class 1					
Class of the web						
Steel	$f_{y,w}$	=	355 MPa	$_{w}$	=	0.814
Slenderness:	c / t	=	52.97			
Plastic distribution factor		=	0.50			
Class of the web	1					
Check of the resistance (Class1)						
Steel	$f_{y,top}$	=	355 MPa	$f_{y,bot}$	=	355 MPa
Partial factor	$_{M0}$	=	1.00			
Plastic resistant moment	$M_{pl,Rd}$	=	287.74 kNm			
Check	$_{Mg}$	=	0.435			

Shear resistance of gross sections

Section at left end (Section no 1) - Combination U5						
Height of the cross-section	h	=	400.0 mm			
Shear area	$A_{v,top}$	=	1535.9 mm^2	$A_{v,bot}$	=	1535.9 mm^2
Yield strengths	$f_{y,top}$	=	355 MPa	$f_{y,bot}$	=	355 MPa
Shear design force	V_{Ed}	=	42.22 kN			
Shear resistance force	V_{plRd}	=	629.60 kN	$_{M0}$	=	1.00
Check	$_{Vg}$	=	0.067			

Resistance to lateral torsional buckling

Combination U5						
Check of lower flange						
Part between sections laterally maintained in x = 0.0 m and x = 12.00 m						
Length of the part	L	=	12.00 m			
Moments at ends	$M_{end,l}$	=	0.00 kNm	$M_{end,r}$	=	0.00 kNm
Maximum moment	M_{Ed}	=	126.66 kNm			
Maximum normal force in chord	N_{Ed}	=	338.54 kN			
Properties of the chord section	A_0	=	1868.3 mm^2	$I_{z,0}$	=	209.7 cm^4
Yielding strength	f_y	=	355 MPa			
Height of the tee	h_{Te}	=	70.0 mm			
Isostatic moment distribution	C_1	=	1.132			
Critical normal force	N_{cr}	=	34.17 kN			

Reduced slenderness	b	=	4.406
Reduction factor (curve "c")		=	0.046
Partial factor	M1	=	1.000
Resistant normal force	$N_{b\,Rd}$	=	30.74 kN
Check	LT	=	11.012

Minimal throat thickness at post no 1

Combination U5

Width of the post	w	=	320.0 mm			
Ultimate strength	f_u	=	470.0 MPa	β_w	=	0.90
Moments at openings sections	$M_{Ed\,l}$	=	-34.43 kNm	$M_{Ed,r}$	=	-74.78 kNm
Spacings between tee chords	$d_{G\,l}$	=	374.1 mm	$d_{G,r}$	=	374.1 mm
Axial forces in lower chords	$N_{m\,Ed\,l}$	=	-92.02 kN	$N_{m,Ed,r}$	=	-199.9 kN
Force and moment in the post	$V_{h\,Ed}$	=	107.9 kN	$M_{h,Ed}$	=	0.0 kNm
Partial factor	M2	=	1.25			
Throat thickness	a	=	0.699 mm			

Warning: the throat thickness is assessed by assuming two welds
The total thickness of welds should be at least 1.40 mm

SERVICEABILITY LIMIT STATES (SLS)

Deflections

v : Maximum vertical deflection of the beam

Under elementary load cases

Permanent loads (G) :	v = 4.01 mm (S11)	= L / 2993
Live loads 1 (Q1) :	v = 30.15 mm (S11)	= L / 398
W (Q2) :	v = -86.52 mm (S11)	= L / 139

Under SLS Combinations

S1 = 1.00 G + 1.00 Q1 :	v = 34.2 mm (S11)	= L / 351

The user has to check whether the deflections are acceptable according to the project requirements and to consider a precambering if necessary.

Natural frequencies

Load case / Combination	Mass assumed to be concentrated	Mass assumed to be distributed
G	7.89Hz	8.99Hz
G + 0.1 Q1	5.96Hz	6.79Hz
G + 0.2 Q1	4.99Hz	5.68Hz
G + 0.3 Q1	4.37Hz	4.98Hz
G + 0.4 Q1	3.94Hz	4.49Hz
G + 0.5 Q1	3.62Hz	4.12Hz

3.3.4. Saćasti nosač IPE 300

IPE 300

Parameters

General Parameters

Non composite Beam

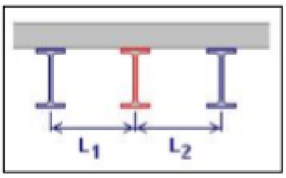
End supports :	Simply supported beam
Horizontal span length :	L = 12.00 m
Total number of openings :	n = 8
Dimensions of the openings :	
Height :	a_0 = 280.0 mm
Length of the sinusoide :	s = 360.0 mm
Length of the flat part :	w_o = 360.0 mm
Web post width :	$w_p = w_o$ = 360.0 mm
Spacing between openings center :	$e = 2\ s + w_o + w_p$ =1440 mm
End web posts widths :	$w_{end,l}$ = 420.0 mm $w_{end,r}$ = 420.0 mm
Mass :	m = 511 kg
Total paint surface :	S = 15.67 m^2
Paint surface (without upper face) :	S' = 13.87 m^2
Massiveness :	M = 240.85 m^{-1}
Massiveness (without upper face) :	M' = 213.18 m^{-1}

Checking of the ANGELINA scope

Spacing cutting / flange inner face :	d = 69.30 mm	≥ 50.00 mm	OK
Spacing cutting / web-flange root :	d = 54.30 mm	≥ 10.00 mm	OK
Dimensions of an opening :	(2b+w)/a = 3.86	≤ 5.00	OK
Web slenderness :	h_w / t_w = 54.73	≤ $124.0\varepsilon_w$ = 100.9	OK

Position of the beam

The studied beam is an intermediate beam.



Spacing of the beam	- to the adjacent left beam :	L_1 = 3.350 m
	- to the adjacent rigth beam :	L_2 = 3.350 m

Width for the calculation of the surface loads supported by the beam :

on the left side :	d_1 = 1.675 m
on the right side :	d_2 = 1.675 m
Total width :	$d_1 + d_2$ = 3.350 m

Lateral restraint

Concentrated lateral restraints :

ULTIMATE LIMIT STATES (ULS)

Note: the calculation method applies to steel rolled profiles only.

Summary of the criteria

S = Satisfactory   NS = Not satisfactory

Checkings of net sections at openings

Resistance to shear force (Open. no 1 - Comb. U5) :	$\Gamma_{V,max}$	=	0.097	< 1	S
Resistance to M+N interaction (Open. no 1 - Comb. U5) :	$\Gamma_{MN,max}$	=	0.393	< 1	S
Resistance to M+N+V interaction (Open. no 1 - Comb. U5) :	$\Gamma_{MNV,max}$	=	0.393	< 1	S

Web checkings

Shear buckling check required (Post no 1 - Comb. U5) :	$\Gamma_{Vbw,max}$	=	0.044	< 1	S

Posts checkings

Resistance to shear (Post no 1 - Comb. U5) :	$\Gamma_{Vh,max}$	=	0.138	< 1	S

Minimum throat thickness

Intermediate posts (Post no 1 - Comb. U5) : a_{min} = 0.54 mm

Warning: the throat thickness is assessed by assuming two welds

The total thickness of welds should be at least 1.08 mm

End posts (Post no 0 - Comb. U5) : a_{min} = 0.44 mm

The calculation for end posts does not take into account the details of the joint

Warning : the throat thickness of the fillet weld must be at least 3 mm (EC3)

Gross sections checkings

Resistance to bending (Post no 4 - Comb. U5) :	$\Gamma_{Mg,max}$	=	0.302 (Classe 1)	< 1	S
Resistance to shear (Left end - Comb. U5) :	$\Gamma_{Vg,max}$	=	0.051	< 1	S

Other checkings

Resistance to lateral torsional buckling	$\Gamma_{LT,max}$	=	**6.129**	**> 1**	**NS**

ULS Combinations checkings

ULS Combination U1   **U1 = 1.35 G + 1.50 Q1 + 1.05 Q2**

Final Γ_{MNV} criteria for the opening	Γ_{MNV} = 0.393			

Shear buckling

Section at web post no 1						
ULS Combination U5						
Web dimensions	h_w	=	418.6 mm	t_w	=	7.1 mm
Yield strengths	f_y	=	355 MPa	ε	=	0.814
	η	=	1.20			
h_w / t_w = 58.96 > 72ε /η = 48.82	Shear buckling check is required					
Reduced slenderness	λ_w	=	0.84			
Reduction factor	χ_w	=	0.99			
Shear force	V_{Ed}	=	26.80 kN			
Shear buckling resistance	$V_{bw,Rd}$	=	602.83 kN			

Check	Γ_{Vbw}	=	0.044			

Resistance of Web post no 1 to horizontal shear

Combination U5						
Tee geometrical centres	d_G	=	410.6 mm			
Bending moments	$M_{Ed,l}$	=	-32.87 kNm	$M_{Ed,r}$	=	-71.45 kNm
Axial forces in tees	$N_{m,Sup,l}$	=	-80.05 kN	$N_{m,Inf,l}$	=	80.05 kN
	$N_{m,Sup,r}$	=	-174.0 kN	$N_{m,Inf,r}$	=	174.0 kN
Horizontal shear force in post	V_{hm}	=	-93.98 kN			
In adjacent openings:	$\Gamma_{N,max}$	=	0.223			
Extra resistance parameters	Ω	=	1.167	χ = 1.000		
	ξ	=	0.182	β = 0.508		
Intermediate post - Extra resistance				η = 1.300		
Post width	w	=	360.0 mm			
Resistant shear forces	V_{hRd}	=	681.04 kN			
Checkings	Γ_{Vh}	=	0.138			

Bending resistance of gross sections

Section at web post no 4 (Section no 10) - Combination U5						
Internal moment and force	M_{Ed}	=	-111.65 kNm	N_{Ed}	=	0.00 kN
Lower flange under compression:	Class 1					
Class of the web						
Steel	$f_{y,w}$	=	355 MPa	ε_w	=	0.814
Slenderness:	c / t	=	54.73			
Plastic distribution factor	α	=	0.50			
Class of the web	1					
Check of the resistance (Class1)						
Steel	$f_{y,top}$	=	355 MPa	$f_{y,bot}$	=	355 MPa
Partial factor	γ_{M0}	=	1.00			
Plastic resistant moment	$M_{pl,Rd}$	=	369.14 kNm			
Check	Γ_{Mg}	=	0.302			

Shear resistance of gross sections

Section at left end (Section no 1) - Combination U5						
Height of the cross-section	h	=	440.0 mm			
Shear area	$A_{v,top}$	=	1781.1 mm^2	$A_{v,bot}$	=	1781.1 mm^2
Yield strengths	$f_{y,top}$	=	355 MPa	$f_{y,bot}$	=	355 MPa
Shear design force	V_{Ed}	=	37.22 kN			
Shear resistance force	V_{plRd}	=	730.10 kN	γ_{M0}	=	1.00
Check	Γ_{Vg}	=	0.051			

Resistance to lateral torsional buckling

Combination U5						
Check of lower flange						
Part between sections laterally maintained in x = 0.0 m and x = 12.00 m						
Length of the part	L	=	12.00 m			
Moments at ends	$M_{end,l}$	=	0.00 kNm	$M_{end,r}$	=	0.00 kNm
Maximum moment	M_{Ed}	=	111.65 kNm			
Maximum normal force in chord	N_{Ed}	=	268.00 kN			
Properties of the chord section	A_0	=	2193.6 mm^2	$I_{z,0}$	=	301.6 cm^4
Yielding strength	f_y	=	355 MPa			
Height of the tee	h_{Te}	=	80.0 mm			
Isostatic moment distribution	C_1	=	1.132			
Critical normal force	N_{cr}	=	49.14 kN			

Reduced slenderness	λ_b	=	3.981			
Reduction factor (curve "c")	χ	=	0.056			
Partial factor	γ_{M1}	=	1.000			
Resistant normal force	$N_{b,Rd}$	=	43.72 kN			
Check	Γ_{LT}	=	6.129			

Minimal throat thickness at post no 1

Combination U5

Width of the post	w	=	360.0 mm			
Ultimate strength	f_u	=	470.0 MPa	β_w	=	0.90
Moments at openings sections	$M_{Ed,l}$	=	-32.87 kNm	$M_{Ed,r}$	=	-71.45 kNm
Spacings between tee chords	$d_{G,l}$	=	410.6 mm	$d_{G,r}$	=	410.6 mm
Axial forces in lower chords	$N_{m,Ed,l}$	=	-80.05 kN	$N_{m,Ed,r}$	=	-174.0 kN
Force and moment in the post	$V_{h,Ed}$	=	93.98 kN	$M_{h,Ed}$	=	0.0 kNm
Partial factor	γ_{M2}	=	1.25			
Throat thickness	a	=	0.541 mm			

Warning: the throat thickness is assessed by assuming two welds
The total thickness of welds should be at least 1.08 mm

SERVICEABILITY LIMIT STATES (SLS)

Deflections

v : Maximum vertical deflection of the beam

Under elementary load cases

Permanent loads (G) :	v = 3.39 mm (S10)	= L / 3543
Live loads 1 (Q1) :	v = 21.74 mm (S10)	= L / 552
Live loads 2 (Q2) :	v = -62.40 mm (S10)	= L / 192

Under SLS Combinations

S1 = 1.00 G + 1.00 Q1 :	v = 25.1 mm (S10)	= L / 478

The user has to check whether the deflections are acceptable according to the project requirements and to consider a precambering if necessary.

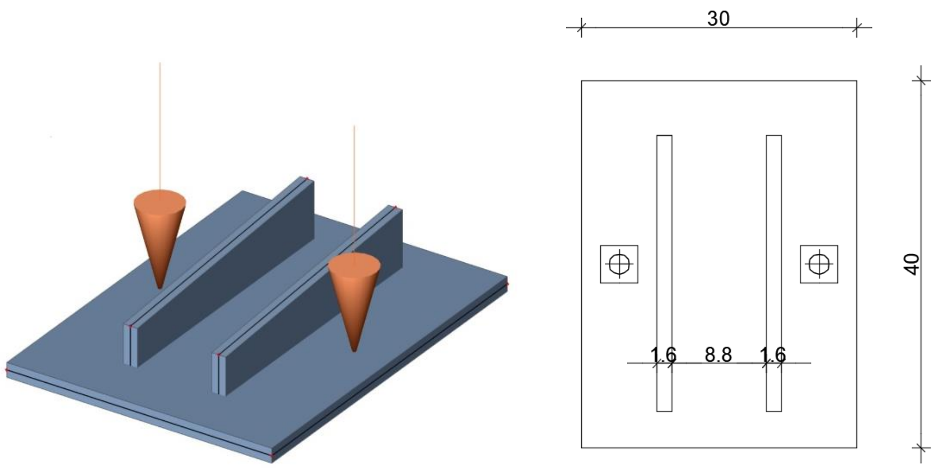
Natural frequencies

Load case / Combination	Mass assumed to be concentrated	Mass assumed to be distributed
G	8.59Hz	9.78Hz
G + 0.1 Q1	6.70Hz	7.63Hz
G + 0.2 Q1	5.68Hz	6.47Hz
G + 0.3 Q1	5.02Hz	5.72Hz
G + 0.4 Q1	4.55Hz	5.18Hz
G + 0.5 Q1	4.18Hz	4.77Hz

4 DIMENZIONIRANJE SPOJA GLAVNE NOSIVE KONSTRUKCIJE I AB STUPA

4.1 Dimenzioniranje spoja

Koristeći von Mises-ovu teoriju čvrstoće, višeosno stanje naprezanja u kratkim čeličnim elementima svodi se na ekvivalentno jednoosno stanje naprezanja. Napon je vrijednost koju koristimo za provjeru da li je materijal dostigao granicu tečenja. Ovaj kriterij se koristi za duktilne materijale, u ovom projektu to je čelik. Von Misesov kriterij kaze da, ako je Von Misesov napon u materijalu pod opterećenjem jednak ili veći od granice tečenja istog materijala pod čistim zatezanjem, onda ce taj material teći. Teorija von Mises se koristi u materijalima koji se nalaze u višeosnim stanjima naprezanja.



Slika 8 : Detalj spoja

...::SECTION CHECK::...

The critical check is on position 0.000 m

Internal forces	Calculated	Unit
N_{Ed}	0.00	kN
$V_{y,Ed}$	0.01	kN
$V_{z,Ed}$	1.69	kN
T_{Ed}	0.00	kNm
$M_{y,Ed}$	-0.94	kNm
$M_{z,Ed}$	-0.01	kNm

Classification for cross-section design
Classification according to EN 1993-1-1 article 5.5.2
Classification of Internal and Outstand parts according to EN 1993-1-1 Table 5.2 Sheet 1 & 2

Id	Type	c [cm]	t [cm]	σ_1 [MPa]	σ_2 [MPa]	ψ [-]	k_σ [-]	α [-]	c/t [-]	Class 1 Limit [-]	Class 2 Limit [-]	Class 3 Limit [-]	Class
1	SO	1.84	0.57	26.353	27.162	1.0	0.4	1.0	3.2	7.3	8.1	11.2	1
3	SO	1.84	0.57	25.558	24.749	1.0	0.4	1.0	3.2	7.3	8.1	11.4	1
4	I	7.46	0.41	20.533	-20.533	-1.0		0.5	18.2	58.6	67.5	100.9	1
5	SO	1.84	0.57	-26.353	-27.162								
7	SO	1.84	0.57	-25.558	-24.749								

The cross-section is classified as Class 1

Bending moment check for M_y
According to EN 1993-1-1 article 6.2.5 and formula (6.12),(6.13)

$W_{pl,y}$	39.4000	cm^3
$M_{pl,y,Rd}$	13.99	kNm
Unity check	0.07	-

Bending moment check for M_z
According to EN 1993-1-1 article 6.2.5 and formula (6.12),(6.13)

$W_{pl,z}$	9.2000	cm^3
$M_{pl,z,Rd}$	3.27	kNm
Unity check	0.00	-

Shear check for V_y
According to EN 1993-1-1 article 6.2.6 and formula (6.17)

η	1.20	
A_v	6.7251	cm^2
$V_{pl,y,Rd}$	137.84	kN
Unity check	0.00	-

Shear check for V_z
According to EN 1993-1-1 article 6.2.6 and formula (6.17)

η	1.20	
A_v	5.0617	cm^2
$V_{pl,z,Rd}$	103.74	kN
Unity check	0.02	-

Combined bending, axial force and shear force check
According to EN 1993-1-1 article 6.2.9.1 and formula (6.41)

$M_{pl,y,Rd}$	13.99	kNm
α	2.00	

$M_{pl,z,Rd}$	3.27	kNm
β	1.00	

Unity check (6.41) = 0.00 + 0.00 = 0.01 -

Note: Since the shear forces are less than half the plastic shear resistances their effect on the moment resistances is neglected.

The member satisfies the section check.

...::STABILITY CHECK::...

Classification for member buckling design
Decisive position for stability classification: 0.000 m
Classification according to EN 1993-1-1 article 5.5.2

5	SO	1.84	0.57	-26.353	-27.162								
7	SO	1.84	0.57	-25.558	-24.749								

The cross-section is classified as Class 1

Lateral Torsional Buckling check
According to EN 1993-1-1 article 6.3.2.1 & 6.3.2.2 and formula (6.54)

LTB parameters		
Method for LTB curve	General case	
Plastic section modulus $W_{pl,y}$	39.4000	cm^3
Elastic critical moment M_{cr}	14.20	kNm
Relative slenderness $\lambda_{rel,LT}$	0.99	
Limit slenderness $\lambda_{rel,LT,0}$	0.20	
LTB curve	a	
Imperfection α_{LT}	0.21	
Reduction factor χ_{LT}	0.67	
Design buckling resistance $M_{b,Rd}$	9.38	kNm
Unity check	0.10	-

Mcr parameters		
LTB length l_{LT}	3.350	m
Influence of load position	no influence	
Correction factor k	1.00	
Correction factor k_w	1.00	
LTB moment factor C_1	2.58	
LTB moment factor C_2	1.55	
LTB moment factor C_3	0.41	
Shear center distance d_z	0.00	cm
Distance of load application z_g	0.00	cm
Mono-symmetry constant β_y	0.00	cm
Mono-symmetry constant z_j	0.00	cm

Note: C parameters are determined according to ECCS 119 2006 / Galea 2002.

Bending and axial compression check

According to EN 1993-1-1 article 6.3.3 and formula (6.61),(6.62)

Bending and axial compression check parameters		
Interaction method	alternative method 1	
Cross-section area A	10.3000	cm^2
Plastic section modulus $W_{pl,y}$	39.4000	cm^3
Plastic section modulus $W_{pl,z}$	9.2000	cm^3
Design compression force N_{Ed}	0.00	kN
Design bending moment (maximum) $M_{y,Ed}$	-0.94	kNm
Design bending moment (maximum) $M_{z,Ed}$	-0.01	kNm
Characteristic compression resistance N_{Rk}	365.65	kN
Characteristic moment resistance $M_{y,Rk}$	13.99	kNm
Characteristic moment resistance $M_{z,Rk}$	3.27	kNm
Reduction factor χ_y	1.00	
Reduction factor χ_z	1.00	
Reduction factor χ_{LT}	0.67	
Interaction factor k_{yy}	1.00	
Interaction factor k_{yz}	0.69	
Interaction factor k_{zy}	0.53	
Interaction factor k_{zz}	1.00	

Maximum moment $M_{y,Ed}$ is derived from beam B9 position 0.000 m.
Maximum moment $M_{z,Ed}$ is derived from beam B9 position 0.000 m.

Shear Buckling check

According to EN 1993-1-5 article 5 & 7.1 and formula (5.10) & (7.1)

Shear Buckling parameters		
Buckling field length a	3.350	m
Web	unstiffened	
Web height h_w	8.86	cm
Web thickness t	0.41	cm
Material coefficient ε	0.81	
Shear correction factor η	1.20	

Shear Buckling verification	
Web slenderness h_w/t	21.61
Web slenderness limit	48.82

Note: The web slenderness is such that Shear Buckling effects may be ignored according to EN 1993-1-5 article 5.1(2).

The member satisfies the stability check.

Odbrani profil sekundarnog nosača je IPE 100.

6 ZAKLJUČAK

Tema ovog diplomskoga rada bila je proračunati glavne elemente čeličnog krova industrijske hale. Odabrani i proračunati profili nosača glavne nosive konstrukcije su IPE 270 (saćasti nosač) duljine 12.0 m, postavljenih na osnom razmaku od 3.35 m. Sekundarna konstrukcija je dimenzionirana od standardnih IPE 100 nosača postavljenih na osnom razmaku od 2,0 m. Projekt je izveden za halu tlocrtnih dimenzija 30.45 x 12.10 m sa jednostrešnim krovom nagiba 7%. Visina hale u strehi iznosi 5.0 m, a u sljemenu 5.85 m. Analiza konstrukcije je provedena računalnim programima SCIA engineer 2018 i ArceloMittal software Angelina. Zbog kompleksnosti samih saćastih profila, te zbog toga što im svojstva poprečnog presjeka nisu jednoznačno definirana, posebna pozornost u projektu je posvećena izradi modela glavnog nosivog sustava krovišta odnosno saćastog nosača. Jednostavnim postupcima rezanja i ponovnog zavarivanja od standardnih vrućevaljanih profila dobivaju se nosači koji imaju moment tromosti veći do 100% i moment otpora veći od 50% uz isti utrošak materijala, odnosno istu vlastitu težinu. Povećanje otpornosti saćastih nosača je nešto manje, ali ipak znatno u odnosu na profil od kojeg su dobiveni. Na kraju se može zaključiti da je kompleksnost izvedbe saćastih nosača znatno manja od prednosti koju ovakvi nosači pružaju te je njihova primjena racionalnija od primjene odgovarajućih standardnih valjanih ili zavarenih profila. Nakon dimenzioniranja nosivih elemenata pristupilo se oblikovanju i proračunu spoja stup-greda. Veza između spoja glavne nosive grede i AB stupa ostvarena je sidrenjem vijaka M20 k.v. 10.9 u AB stup. U zadnjoj fazi izrađeni su detaljni nacrti konstrukcije te nacrti detalja spoja. Također je izveden detaljan radionički nacrt rezanja i ponovnog spajanja IPE profila kojim se dobiva gotovi saćasti nosač. Kod projektiranja svih nosivih elemenata konstrukcije korišten je čelik Fe 510 (S 355). Svi elementi su dimenzionirani prema HRN EN 1993, a korisno opterećenje prema HRN EN 1991. Diplomski rad je izrađen na razini izvedbenog projekta.

7 ISKAZ MATERIJALA

Svi elementi su izrađeni od čelika Fe 510 (S355).

POZICIJA	PROFIL	DULJINA (m)	KOMADA	SPECIFIČNA TEŽINA	UKUPNA TEŽINA (kg)
1	Saćasti IPE 270	12	10	436,0 kg/kom	4360,0
2a	IPE 100	3,41	14	8,1 kg/m'	386,7
2b	IPE 100	3,35	49	8,1 kg/m'	1329,6
