PREDMET: Osnove drevnih konstrukcija

ZADATAK ZA ZAVRŠNI RAD

Opis zadatka: Na temelju zadanih podataka drvenog objekta potrebno je konstruirati i dimenzionirati nosivi sustav.

Način izvedbe: montažno

Materijal konstrukcije: C24/ uporabna klasa 2

Objekt se nalazi na području Zagreba.

Stabilizacija: čelični spregovi

U Splitu, 19.09.2019.

Voditelj Završnog rada: prof.dr.sc. Neno Torić

Dimenzioniranje drvenog objekta

Sažetak:

Na temelju zadanih podataka drvenog objekta potrebno je dimenzionirati glavnu nosivu konstrukciju, spregove konstrukcije i temelje. Objekt se nalazi na području Zagreba. Proračun se provodi na temelju graničnog stanja nosivosti (GSN) i graničnog stanja uporabljivosti (GSU). Iznosi unutarnji sila dobiveni su u računalnom programu „SCIA Engineer 18.1“.

Ključne riječi:

Drvo, nosiva konstrukcija, spregovi, grede, stup, dimenzioniranje, spojevi

Design of a timber structure

Abstract:

Based on the information about the timber structure, the assignment is to design this structure: its main supporting structure, bracings and foundations. The object is located in Zagreb. Structure calculations are based on ultimate limit state (ULS) and serviceability limit state (SLS). The results of the internal forces were calculated in „SCIA Engineer 18.1“.

Keywords:

Timber, load-bearing structure, bracings, beams, column, design, joints.

1.0 TEHNIČKI OPIS

1.1 OPIS KONSTRUKCIJE

Predmet ovoga završnog rada je konstrukcija i dimenzioniranje nosivog sustava drvenog objekta. Objekt se nalazi na području Zagreba. Na temelju arhitektonskih nacrta, doneseno je moguće rješenje dimenzioniranja objekta urađeno je u računalnom programu "Scia Engineer". Tlocrte dimenzije objekta su 9x9 m te visina je 6 m. Vertikalno je razdijeljen na 0dva kata koja povezuje stubište. Konstrukcija je izrađena od drva klase C24 i uporabne klase 2. Konstrukcija je zamišljena kao sustav sačinjen od nosivih stupova i greda, te međukatnih greda. Stabilizacija objekta ostvarena je čeličnim spregovima. Međukatna konstrukcija je lijepljeni panelni sustav dok je fasada staklena, a kao pokrov koriste se sendvič paneli. Objekt je predviđen stanovanju. Vanjski stupovi konstrukcije su zglobno vezani s temeljem. Greda je upeto vezana za stupove.

3D prikaz konstrukcije objekta

1.2 STATIČKA ANALIZA KONSTRUKCIJE

Proračun je izvršen prema EC1 i EC5. Konstrukcija je izložena djelovanju sljedećih opterećenja: vlastita težina, dodatno stalno opterećenje, korisno opterećenje, snijeg i vjetar. Odgovarajući koeficijenti za vjetar i snijeg uzeti su s obzirom na lokaciju objekta iz propisanih tablica.

Za statički proračun GSN uzete su kombinacije na temelju proračunskih djelovanja, a za GSU karakteristična i nazovistalna kombinacija koje generira software.

1.3 KONSTRUKTIVNI ELEMENTI

Krovne grede C24

Pozicija 1

Panelni sustav- grede 160/240 i OSB/3 debljine 40 mm

Pozicija 2

Panelni sustav- grede 120/200 i OSB/3 debljine 40 mm

Pozicija 3

Panelni sustav- grede 160/220 i OSB/2 debljine 40 mm

Pozicija 4

Panelni sustav- grede 140/200 i OSB/2 debljine 40 mm

Stupovi

Stupovi su također C24 dužine 600 cm, a poprečnog presjeka 220;260

Spregovi

Za stabilizaciju su odabrani čelični spregovi RD16.

1.4 ZAŠTITA ELEMENATA

Zaštita nosivih elemenata se vrši fungicidnim premazima za zaštitu od prodora vode i nametnika. Zaštita se provodi s tri premaza, s tim da je dva premaza potrebno nanijeti u tvornici prije transporta, a treći završni nakon potpunog „zatvaranja“ konstrukcije. Nosači se nakon toga pakiraju u PVC da se zaštite od vlage i vanjskih utjecaja. Zaštita metalnih dijelova i spajala izvodi se pocićavanjem na uobičajen način, a u skladu s važećim propisima sve metalne dijelove prije pocićavanja potrebno je obraditi. Tako pripremljeni nosači se transportiraju na odredište.

U svrhu odugovlačenja zagrijavanja konstruktivnih elemenata predmetne hale, svi takvi elementi (spregovi) moraju se zaštiti posebnim premazima otpornim na visoke temperature. Također je potrebno opremiti objekt za slučaj nastanka požara uređajima za najavu požara kao i opremom za njegovo gašenje.

1.5 TRANSPORT I MONTAŽA

Transportna trasa mora biti točno utvrđena pri čemu se mora voditi računa o radijusu krivina prema zahtjevima specijalnih vozila i slobodnim profilima. Montaža se obavezno mora

Dimenzioniranje drvenog objekta

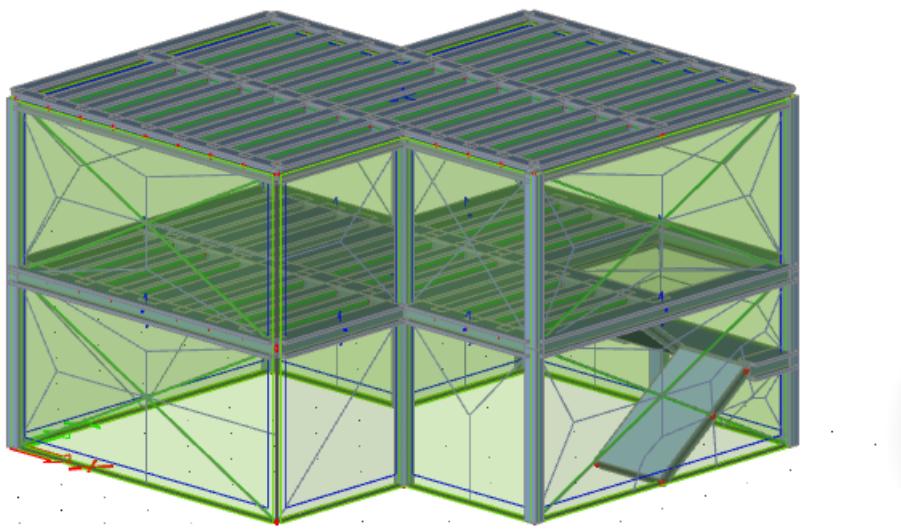

provesti prema planu montaže. Svi elementi predgotovljeni stižu na gradilište. Nulta faza montaže, nakon izvedenih svih prethodno potrebnih radova, je montaža stupova. Kada se stup postavi na ankere koji su postavljeni u temelje, stup se pridržava dizalicom dok se ne postigne vertikalnost. . Potom se postavljaju spregovi između stupova. Kad se prva dva stupa povežu oni postaju stabilni te se tim redoslijedom nastavlja i ostatak konstrukcije.

Transport i montažu je potrebno provesti tako da se izbjegnu eventualna oštećenja nosača.

2.0 ANALIZA OPTEREĆENJA

2.1 VLASTITA TEŽINA

Vlastita težina je opterećenje koje ovisi o geometriji i materijalu od kojega je konstrukcija izrađena i ono je automatski generirano u software-u.

2.2 DODATNO STALNO DJELOVANJE

Opterećenje od ostalih elemenata (slojevi poda, krovni paneli itd.)

Opterećenje ravnog krova:

-sendvič panel	0.20 kN/m ²
-instalacije	0.10 kN/m ²
UKUPNO	0.30 kN /m²

Opterećenje međukatne konstrukcije:

-parket (2 cm)	0.12 kN/m ²
-cementni estrih (4 cm)	0.96 kN/m ²
-stiropor	0.02 kN/m ²
-vlagootporna ploča od iverice (18 mm)	0.11 kN/m ²
-mineralna vuna između greda (20 cm)	0.10 kN/m ²
-drvene grede	uključeno u vlastitu težinu
-vatrootporne gipsane ploče (12.5 mm)	0.09 kN/m ²

UKUPNO 1.4 kN/m²

Stubište: 3 kN/m²

Staklena fasada: 0.25 kN/m²

2.3 UPORABNO DJELOVANJE

Kategorija	Namjena	Primjer
A	Prostori za stanovanje i kućanske djelatnosti	Sobe u stambenim zgradama i kućama, sobe i odjeli u bolnicama; sobe u hotelima i prenoćišta, kuhinje i kupaonice
B	Uredski prostori	
C	Prostori gdje se mogu okupljati ljudi (osim prostora određenih u kategorijama A, B, i D1)	C1: Prostорије са столовима и сл., примјерице у школама, каванама, ресторанима, благојаonicама, читаоницама, recepcijama C2: Prostori s nepomičnim sjedalima, примјерице у црквама, казалиштима или кинима, собе за састанке, dvorane za predavanja, dvorane za skupove, željezničke čekaonice i sl. C3: Prostori bez zapreka za kretanje ljudi, примјерice у музејима, излоžbenim prostorima и слично, те приступи у javnim i upravnim zgradama, hotelima, bolnicama i željezničkim stanicama C4: Prostori gdje su moguće fizičke aktivnosti, примјерице plesne dvorane, gimnastičke dvorane, pozornice C5: Prostori za velika okupljanja ljudi, примјерице у zgradama za javne priredbe као што су koncertне dvorane, sportske dvorane uključujući gledališta, terase, prilaze i željezničke perone.
D	Prodajni prostori	D1: Prostori u trgovinama D2: Prostori u robnim kućama

Usvojeno opterećenje: $q_k = 1.5 \text{ kN/m}^2$ - kategorija A, stambeni prostori

2.4 DJELOVANJE SNIJEGA

$$s = s_k * \mu_i * c_e * c_t \quad [\text{k N/m}^2]$$

s_k =karakteristična vrijednost opterećenja na tlu

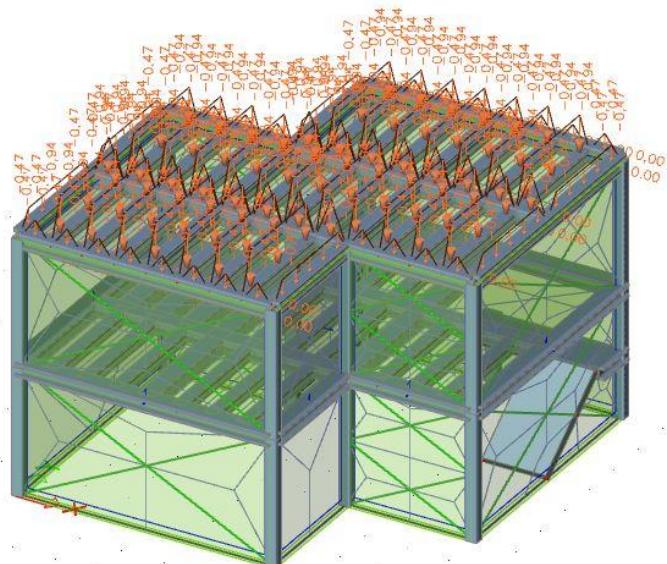

$s_k = 1.25 \text{ kN/m}^2$ za Zagreb, od 100-200 metara nadmorske visine

Opterećenje snijegom preko cijele krovne plohe prema "SCIA Engineer."

Dimenzioniranje drvenog objekta

Nadmorska visina do [m]	1. područje – priobalje i otoci [kN/m ²]	2. područje – zalede Dalmacije, Primorja i istre [kN/m ²]	3. područje – kontinentalna Hrvatska [kN/m ²]	4. područje – gorska Hrvatska [kN/m ²]

Dimenzioniranje drvenog objekta

2.5 DJELOVANJE VJETRA

Proračun djelovanja vjetra na konstrukciju je izведен u programu “SCIA Engineer“ koristeći opciju 3D wind generator prema propisanim Eurocode normama za vjetar.

$$w_e = q_{ref} * c_e(z_e) * c_{pe} \text{ (kN/m}^2\text{)} - \text{pritisak vjetra na vanjske površine}$$

$$w_i = q_{ref} * c_i(z_i) * c_{pi} \text{ (kN/m}^2\text{)} - \text{pritisak vjetra na unutarnje površine}$$

q_{ref} => referentni pritisak srednje brzine vjetra

$c_e(z_e)$, $c_i(z_i)$ => koeficijenti izloženosti koji uzimaju u obzir neravnine terena

z_e , z_i => referentne visine za lokalni ili unutarnji tlak

c_{pe} , c_{pi} => vanjski i unutarnji koeficijenti pritiska

Proračun referentnog pritiska vjetra q_{ref} :

v_{ref} => referentna brzina

$v_{ref,0} = 20 \text{ m/s}$ za područje III, Zagreb, do 100m nadmorske visine

$$v_{ref} = c_{DIR} * c_{TEM} * c_{ALT} * v_{ref,0}$$

$v_{ref,0}$ => osnovna poredbena brzina vjetra

c_{DIR} => koeficijent smjera vjetra

$$c_{DIR} = 1,0$$

c_{TEM} => koeficijent ovisan o godišnjem dobu

$$c_{TEM} = 1,0$$

ρ => gustoća zraka

$$\rho = 1.25 \text{ kg/m}^3$$

3.0 PRORAČUN KONSTRUKCIJE

3.1 KOMBINACIJA

Proračun konstrukcije izvršen je u programskom paketu Scia Enginner sa prostornim modelom konstrukcije prema najkritičnijoj kombinaciji.

Contents of combination	
vlastita tezina - Self weight ...	1.35
dodatno stalno [-]	1.35

$$NEd = 100,07 \text{ kN}$$

$$VED = 1,5 \text{ kN}$$

Proračun vijaka u spju

Spoj je dvorezan nc=2. Pretpostavljen je broj vijaka $n = 8$ promjera $d = 20 \text{ mm}$ (klasa 5.8).

Proračun sila u najkriticnijem spoju

$$FM, V = \frac{MEd \cdot x_{\max}}{nc \cdot \sum(x_i^2 + y_i^2)} = 0 \text{ kN}$$

$$FM, H = \frac{MEd \cdot y_{\max}}{nc \cdot \sum(x_i^2 + y_i^2)} = 0 \text{ kN}$$

$$FW = \sqrt{\left(F_{MV} + \frac{N_{Ed}}{n_c * n}\right)^2 + \left(F_{MH} + \frac{V_{Ed}}{n_c * n}\right)^2} = \sqrt{\left(0,0 + \frac{100,07}{2 * 8}\right)^2 + \left(0,0 + \frac{1,5}{2 * 8}\right)^2} = 6,26 \text{ kN}$$

$$\alpha = \tan \left(\frac{F_{MH} + \frac{V_{Ed}}{n_c * n}}{F_{MV} + \frac{N_{Ed}}{n_c * n}} \right) = \tan \left(\frac{0,00 + \frac{1,5}{2 * 8}}{0,00 + \frac{100,07}{2 * 8}} \right) = \tan 0,01499 = 0,86^\circ$$

Vijci su klase 5.8:

$$fuk = 500 \text{ MPa}$$

$$d = 20 \text{ mm}$$

$$My, Rk = 0,3 \cdot fuk \cdot d^2,6 = 0,3 \cdot 500 \cdot 20^2,6 = 362100 \text{ Nmm}$$

$$\rho_k = 350 \frac{\text{kg}}{\text{m}^3}$$

$$f_{h,0,k} = 0,082 \cdot (1 - 0,01d) \cdot \rho_k = 0,082 \cdot (1 - 0,01 \cdot 20) \cdot 350 = 23 \frac{\text{N}}{\text{mm}^2}$$

$$k90 = 1,35 + 0,015d = 1,35 + 0,015 \cdot 20 = 1,65$$

$$fh, \alpha, k = \frac{f_{h,0,k}}{k_0 \cdot \sin(\alpha)^2 + \cos(\alpha)^2} = \frac{23}{1,65 \cdot \sin(0,86)^2 + \cos(0,86)^2} = 23 \text{ MPa}$$

t- debljina lima

$$t=20 \text{ mm}$$

Vlačna čvrstoća vijaka u skladu s EK5 standardom treba uzeti kao manju vrijednost

a) vlačna čvrstoća vijka

$$f_{uk} \cdot A_s = 500 \cdot 245 = 122,5 \text{ kN}$$

b) nosivost ploče

$$dw = \min(4d, 12t) = \min(4 \cdot 20; 12 \cdot 20) = 80 \text{ mm}$$

$$3 \cdot f_{c90k} \cdot \frac{\pi}{4} \cdot (d_w^2 - (d + 1 \text{ mm})^2) = 3 \cdot 2,7 \cdot \frac{\pi}{4} \cdot (80^2 - (20 + 1 \text{ mm})^2) = 37,91 \text{ kN}$$

$$f_{c90k} = 2,7 \text{ MPa}$$

c) Konačna vlačna čvrstoća:

$$f_{uk} \cdot A_s = 122,5 \text{ kN}$$

Čvrstoća na čupanje vijka

$$F_{ax,Rk} = 37,91 \text{ kN}$$

Karakteristična nosivost u ravnini smicanja

$$F_{v,Rk} = \min \left\{ \frac{0,5 \cdot f_{h,2,k} \cdot t_2 \cdot d = 0,5 \cdot 23 \cdot 25 \cdot 2 = 57,5 \text{ kN}}{2,3 \cdot \sqrt{2 * M_{y,Rk} * f_{h,2,k*d}}} + \frac{F_{ax,Rk}}{4} = 2,3 \cdot \sqrt{2 * 362100 * 23 * 20} + \frac{37,91}{4} \right. \\ \left. = 41,98 \text{ kN} \right.$$

$$F_{v,Rk} = 41,98 \text{ kN}$$

$$b) \frac{\frac{F_{ax,Rk}}{4}}{2,3 \cdot \sqrt{2 * M_{y,Rk} * f_{h,2,k*d}}} = \frac{\frac{37,91}{4}}{2,3 \cdot \sqrt{2 * 362100 * 23 * 20}} = 0,23 < 0,25$$

$$F_{v,Rk} = 41,98 \text{ kN}$$

Proračunska čvrstoća vijka

$$kmod = 0,8$$

$$\gamma M = 1,3$$

$$F_{v,Rd} = kmod * \frac{F_{v,Rk}}{\gamma M} = 0,8 * \frac{41,98}{1,3} = 25,83 \text{ kN}$$

Proračun efektivnog broja vijaka u spoju

Dimenzioniranje drvenog objekta

Minimalna udaljenost vijaka:

$$a_{min} = 4 \cdot d = 4 \cdot 2 = 8 \text{ cm}$$

Broj vijaka postavljenih paralelno s vlakancima:

$$n_{ef} = n^{0,9*^4} \sqrt{\frac{a_1}{13d}} = 8^{0,9*^4} \sqrt{\frac{10}{132}} = 5,12$$

Broj vijaka postavljenih okomito na vlakanca:

$$nef = n = 8$$

Interpolacijom se dobije:

$$nef,fin = 6,56$$

Konačna nosivost vijka

$$F_{v,Rd,fin} = \frac{F_{v,Rd} \cdot nef,fin}{n} = \frac{25,83 * 6,56}{8} = 21,2 \text{ kN}$$

Kontrola najopterećenijeg spoja:

$$\frac{F_w}{F_{v,Rd,fin}} = \frac{6,26}{21,2} = 0,30 < 1$$

6. PRORAČUN TEMELJA

Proračun dimenzija temelja samca.

$$L=0,6 \text{ m}$$

$$B=0,6 \text{ m}$$

$$H=0,6 \text{ m}$$

$$\text{Dopušteno naprezanje u tlu : } \sigma = 400 \frac{kN}{m^2}$$

Beton C25/30

$$f_{ck} = 2,5 \frac{kN}{m^2}$$

Čelik B500B

$$f_{yk} = 50,0 \frac{kN}{cm^2}$$

$$N_{sd} = 59,42 \text{ kN}$$

Površina temeljne stope::

$$A = 0,6 * 0,6 = 0,36 \text{ m}^2$$

Težina temeljne stope:

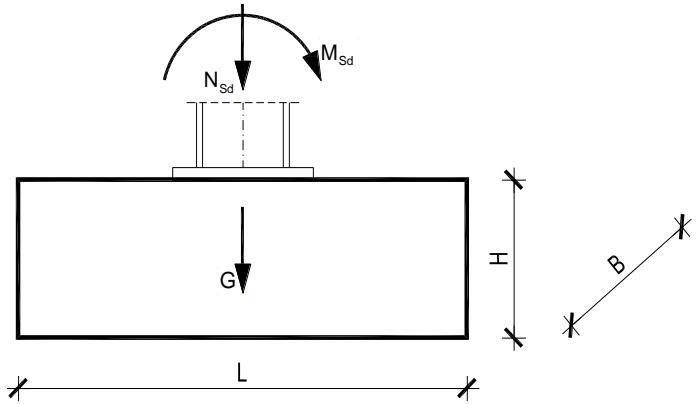

$$G = L * B * H * \gamma_b = 0,6 * 0,6 * 0,6 * 25 = 5,4 \text{ kN}$$

Naprezanje u tlu ispod temeljne stope na dubini temeljenja

$$\sigma_{1,2} = \frac{N_{sd} + G}{A} = \frac{59,42 + 5,4}{0,36} = 180,1 \frac{kN}{m^2}$$

$$L' = 3 * \left(\frac{L}{2} - e \right) = 3 * \left(\frac{0,6}{2} - 0 \right) = 0,9 \text{ m}$$

$$\sigma_{ekv} = \frac{2 * (N_{sd} + G)}{L' * B} = \frac{2 * (59,42 + 12,8)}{0,8 * 0,8} = 360,11 \frac{kN}{m^2} \leq \sigma_{dop,tla} = 400 \frac{kN}{m^2}$$

Proračun armature temelja

$$L_1 = \frac{L - h_{stup}}{2} = \frac{1 - 0,26}{2} = 0,37 \text{ m}$$

$$\sigma_{1-1} = \frac{L' - L_1}{L'} * \sigma_{ekv} = \frac{0,9 - 0,37}{0,9} * 360,11 = 212,06 \frac{kN}{m^2}$$

$$M_{Sd}^{1-1} = Y * \left(\sigma_{1-1} * \frac{L_1^2}{2} * B + \frac{\sigma_{ekv} - \sigma_{1-1}}{2} * L_1 * B * \frac{2}{3} * L_1 \right)$$

$$\begin{aligned} M_{Sd}^{1-1} &= 1,4 * (212,06 * \frac{0,37^2}{2} * 0,6 + \frac{360,11 - 212,06}{2} * 0,37 * 0,6 * \frac{2}{3} * 0,37) \\ &= 17,9 \text{ kNm} \end{aligned}$$

Krak unutarnjih sila u betonu

$$z \approx 0,8 * H = 0,8 * 0,6 = 0,48 \text{ m} = 48 \text{ cm}$$

Potrebna površina armature

$$A_{S1} = \frac{M_{Sd}^{1-1}}{z * F_y k} = \frac{1790}{48 * \frac{50}{1,15}} = 0,86 \text{ cm}^2 < A_{S1,min} = \frac{0,1}{100} * 0,6 * 0,6 = 3,6 \text{ cm}^2$$

Odobrana je minimalna armatura

$$4 \varnothing 12 \quad A = 4,52 \text{ cm}^2$$

Relative slenderness λ	12,15	0,62	-
Limit slenderness	0,30	0,30	-
Imperfection β_c	0,20	0,20	-
Reduction factor kc	0,01	0,91	-

Unity check (6.23) = $0,62 + 0,19 + 0,08 = 0,89$ -Unity check (6.24) = $0,00 + 0,19 + 0,08 = 0,27$ -

Warning: The slenderness 716,67 is larger than the limit value 200,00!

Beams subjected to bending or combined bending and compression

According to EN 1995-1-1 article 6.3.3 and formula (6.33),(6.35)

LTB Parameters		
Elastic critical moment $M_{y,crit}$	105,40	kNm
Critical bending stress $\sigma_{m,crit}$	42,5	MPa
Relative slenderness $\lambda_{rel,m}$	0,75	-
Reduction factor k_{crit}	1,00	-

Unity check (6.33) = $0,20$ -Unity check (6.35) = $0,04 + 0,00 = 0,04$ -

My,crit Parameters		
G0,05	462,5	MPa
LTB length L	3,000	m
Lef/L	0,90	
Effective length Lef	2,700	m
Influence of load position	no influence	

The member satisfies the stability check.

Timber ULS check

Linear calculation, Extreme : Cross-section

Selection : All

Combinations : ULS-Set B (auto)

Cross-section : greda medukatna - glavne - I non-symm (200; 140; 400; 50; 400; 50)

EN 1995-1-1 Code Check

Beam B18	9,000 m	greda medukatna - glavne - I non-symm (200; 140; 400; 50; 400; 50)	C24 (EN 338)	ULS-Set B (auto)	0,66 -
-----------------	----------------	---	---------------------	-------------------------	---------------

Combination key

ULS-Set B (auto) / 1.35*vlastita tezina + 1.35*dodatno stalno + 1.50*Uporabno opterećenje + 0.90*3DWind7

Basic data

Partial safety factor yM for Solid timber 1,30

Material data

Bending (fm,k)	24,0	MPa
Tension (ft,0,k)	14,5	MPa
Tension (ft,90,k)	0,4	MPa
Compression (fc,0,k)	21,0	MPa
Compression (fc,90,k)	2,5	MPa
Shear (fv,k)	4,0	MPa
Type of timber	Solid	

The critical check is on position **6,000 m**.

Internal forces

NEd	-25,21	kN
Vy,Ed	9,46	kN
Vz,Ed	-38,70	kN
TEd	0,63	kNm
My,Ed	-21,69	kNm
Mz,Ed	8,28	kNm

Modification factor

Service Class	1
Load duration	Short term
Modification factor kmod	0,90

...: SECTION CHECK ::..

Compression parallel to the grain

According to EN 1995-1-1 article 6.1.4 and formula (6.2)

$\sigma_{c,0,d}$	0,4	MPa
$f_{c,0,d}$	14,5	MPa
Unity check	0,03	-

Compression perpendicular to the grain

According to EN 1995-1-1 article 6.1.5 and formula (6.3)

Fc,90,d	55,16	kN
I	100	mm
lef	160	mm
b	400	mm
Aef	64000	mm ²
$\sigma_{c,90,d}$	0,9	MPa
Support condition	Discrete	
h	300	mm
kc,90	1,50	-
$f_{c,90,d}$	1,7	MPa
Unity check	0,33	-

Bending

According to EN 1995-1-1 article 6.1.6 and formula (6.11),(6.12)

$\sigma_{m,y,d}$	4,5	MPa
kh,y	1,00	
fm,y,d	16,6	MPa
$\sigma_{m,z,d}$	2,9	MPa
kh,z	1,00	
fm,z,d	16,6	MPa
km	1,00	

Unity check (6.11) = 0,27 + 0,17 = 0,44

Unity check (6.12) = 0,27 + 0,17 = 0,44

Shear

According to EN 1995-1-1 article 6.1.7 and formula (6.13)

kcr	0,67	
tv,d	0,4	MPa
tz,d	1,8	MPa
fv,d	2,8	MPa
Unity check tv	0,15	-
Unity check tz	0,66	-
Unity check Interaction	0,45	-

Note: The interaction equation has been added as a NCCI.

Torsion

According to EN 1995-1-1 article 6.1.8 and formula (6.14)

τtor,d	0,4	MPa
kshape	1,00	
fv,d	2,8	MPa
Unity check	0,14	-
Unity check Interaction Shear	0,59	-

Note: The interaction equation has been added as a NCCI.

Combined Bending and Axial Compression

According to EN 1995-1-1 article 6.2.4 and formula (6.19),(6.20)

fc,0,d	14,5	MPa
fm,y,d	16,6	MPa
fm,z,d	16,6	MPa
km	1,00	

Unity check (6.19) = 0,00 + 0,27 + 0,17 = 0,44 -

Unity check (6.20) = 0,00 + 0,27 + 0,17 = 0,44 -

The member satisfies the section check.

...:: STABILITY CHECK ::...

Columns subjected to compression or combined compression and bending

According to EN 1995-1-1 article 6.3.2 and formula (6.23),(6.24)

Buckling parameters	yy	zz
Sway type	sway	non-sway
System length L	6,000	0,750
Buckling factor k	1,11	0,92
Buckling length Lcr	6,857	0,691
Slenderness λ	66,33	7,49
Relative slenderness λ	1,12	0,13
Limit slenderness	0,30	0,30
Imperfection βc	0,20	0,20
Reduction factor kc	0,60	1,00

Unity check (6.23) = 0,04 + 0,27 + 0,17 = 0,48 -

Unity check (6.24) = 0,03 + 0,27 + 0,17 = 0,47 -

Beams subjected to bending or combined bending and compression

According to EN 1995-1-1 article 6.3.3 and formula (6.33),(6.35)

LTB Parameters		
Elastic critical moment My,crit	3070,03	kNm
Critical bending stress σm,crit	633,7	MPa
Relative slenderness λrel,m	0,19	-
Reduction factor kcrit	1,00	-

Unity check (6.33) = 0,27 -

Unity check (6.35) = 0,07 + 0,03 = 0,10 -

My,crit Parameters		
G0,05	462,5	MPa
LTB length L	0,750	m
Lef/L	0,90	
Effective length Lef	0,675	m
Influence of load position	no influence	

The member satisfies the stability check.

Timber ULS check

Linear calculation, Extreme : Cross-section

Selection : All

Combinations : ULS-Set B (auto)

Cross-section : greda medukatna - sekundarne - I non-symm (200; 40; 250; 50; 180; 60)

EN 1995-1-1 Code Check

Beam B50	3,000 m	greda medukatna - sekundarne - I non-symm (200; 40; 250; 50; 180; 60)	C24 (EN 338)	ULS-Set B (auto)	0,81 -
-----------------	----------------	--	---------------------	-------------------------	---------------

Combination key

ULS-Set B (auto) / 1.35*vlastita tezina + 1.35*dodatno stalno + 0.75*sniđeg + 1.05*Uporabno opterećenje + 1.50*3DWind6

Basic data

Partial safety factor γM for Solid timber 1,30

Material data

Bending (fm,k)	24,0	MPa
Tension (ft,0,k)	14,5	MPa
Tension (ft,90,k)	0,4	MPa
Compression (fc,0,k)	21,0	MPa
Compression (fc,90,k)	2,5	MPa
